- **What is SuPy?**

SuPy is a Python-enhanced urban climate model with SUEWS as its computation core.

The scientific rigour in SuPy results is thus guaranteed by SUEWS (see SUEWS publications and Parameterisations and sub-models within SUEWS).

Meanwhile, the data analysis ability of SuPy is greatly enhanced by the Python-based SciPy Stack, notably numpy and pandas. More details are described in our SuPy paper.

- **How to get SuPy?**

SuPy is available on all major platforms (macOS, Windows, Linux) for Python 3.6+ (64-bit only) via PyPI:

```
python3 -m pip install supy --upgrade
```

- **How to use SuPy?**

- Please follow [Quickstart of SuPy](#) and [other tutorials](#).
- Please see [API reference](#) for details.
- Please see [FAQ](#) if any issue.

- **How to contribute to SuPy?**

- Add your development via [Pull Request](#)
- Report issues via the [GitHub page](#).
- Cite our [SuPy paper](#).
- Provide suggestions and feedback.

# CHAPTER 1

---

## Tutorials

---

To familiarise users with SuPy urban climate modelling and to demonstrate the functionality of SuPy, we provide the following tutorials in [Jupyter notebooks](#):

The following section was generated from `docs/source/tutorial/quick-start.ipynb`

---

### 1.1 Quickstart of SuPy

This quickstart demonstrates the essential and simplest workflow of `supy` in SUEWS simulation:

1. *load input files*
2. *run simulation*
3. *examine results*

More advanced use of `supy` are available in the [\*tutorials\*](#)

Before start, we need to load the following necessary packages.

```
[1]: import matplotlib.pyplot as plt
import supy as sp
import pandas as pd
import numpy as np
from pathlib import Path
get_ipython().run_line_magic('matplotlib', 'inline')

# produce high-quality figures, which can also be set as one of ['svg', 'pdf', 'retina',
# ↪, 'png']
# 'svg' produces high quality vector figures
%config InlineBackend.figure_format = 'svg'
```

```
[2]: sp.show_version()
```

```
supy: 2019.8.30dev
supy_driver: 2019a4
```

### 1.1.1 Load input files

#### For existing SUEWS users:

First, a path to SUEWS RunControl.nml should be specified, which will direct supy to locate input files.

```
[3]: path_runcontrol = Path('../sample_run') / 'RunControl.nml'
```

```
[4]: df_state_init = sp.init_supy(path_runcontrol)
```

```
INFO:root:All cache cleared.
```

A sample df\_state\_init looks below (note that .T is used here to a nicer tableform view):

```
[5]: df_state_init.filter(like='method').T
```

```
[5]:
```

	grid	98
var	ind_dim	
aerodynamicresistancemethod	0	2
evapmethod	0	2
emissionsmethod	0	2
netradiationmethod	0	3
roughlenheatmethod	0	2
roughlenmommethod	0	2
smdmethod	0	0
stabilitymethod	0	3
storageheatmethod	0	1
waterusemethod	0	0

Following the convention of SUEWS, supy loads meteorological forcing (met-forcing) files at the grid level.

```
[6]: grid = df_state_init.index[0]
df_forcing = sp.load_forcing_grid(path_runcontrol, grid)
```

```
INFO:root:All cache cleared.
```

#### For new users to SUEWS/SuPy:

To ease the input file preparation, a helper function `load_SampleData` is provided to get the sample input for SuPy simulations

```
[7]: df_state_init, df_forcing = sp.load_SampleData()
```

```
INFO:root:All cache cleared.
```

### Overview of SuPy input

#### df\_state\_init

`df_state_init` includes model Initial state consisting of:

- surface characteristics (e.g., albedo, emissivity, land cover fractions, etc.; full details refer to SUEWS documentation)
- model configurations (e.g., stability; full details refer to SUEWS documentation)

Detailed description of variables in `df_state_init` refers to *SuPy input*

Surface land cover fraction information in the sample input dataset:

```
[8]: df_state_init.loc[:,['bldgh','evetreeh','dectreeh']]
```

```
[8]: var      bldgh dectreeh evetreeh
ind_dim    0          0          0
grid
98        22.0      13.1      13.1
```

  

```
[9]: df_state_init.filter(like='sfr')
```

```
[9]: var      sfr
ind_dim (0,) (1,) (2,) (3,) (4,) (5,) (6,)
grid
98      0.43  0.38  0.001  0.019  0.029  0.001  0.14
```

## df\_forcing

`df_forcing` includes meteorological and other external forcing information.

Detailed description of variables in `df_forcing` refers to *SuPy input*.

Below is an overview of forcing variables of the sample data set used in the following simulations.

```
[10]: list_var_forcing = [
    'kdown',
    'Tair',
    'RH',
    'pres',
    'U',
    'rain',
]
dict_var_label = {
    'kdown': 'Incoming Solar\n Radiation ($ \mathrm{W} \mathrm{m}^{-2} )$',
    'Tair': 'Air Temperature ($^{\circ}\mathrm{C}$)',
    'RH': r'Relative Humidity (%)',
    'pres': 'Air Pressure (hPa)',
    'rain': 'Rainfall (mm)',
    'U': 'Wind Speed (m $\mathrm{s}^{-1}$)'
}
df_plot_forcing_x = df_forcing.loc[:, list_var_forcing].copy().shift(
    -1).dropna(how='any')
df_plot_forcing = df_plot_forcing_x.resample('1h').mean()
df_plot_forcing['rain'] = df_plot_forcing_x['rain'].resample('1h').sum()

axes = df_plot_forcing.plot(
    subplots=True,
    figsize=(8, 12),
    legend=False,
)
fig = axes[0].figure
```

(continues on next page)

(continued from previous page)

```
fig.tight_layout()
fig.autofmt_xdate(bottom=0.2, rotation=0, ha='center')
for ax, var in zip(axes, list_var_forcing):
    ax.set_ylabel(dict_var_label[var])
```

## Modification of SuPy input

Given `pandas.DataFrame` as the core data structure of SuPy, all operations, including modification, output, demonstration, etc., on SuPy inputs (`df_state_init` and `df_forcing`) can be done using `pandas`-based functions/methods.

Specifically, for modification, the following operations are essential:

### locating data

Data can be located in two ways, namely: 1. by name via ``.loc`` <[http://pandas.pydata.org/pandas-docs/stable/user\\_guide/indexing.html#selection-by-label](http://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#selection-by-label)>‘`_`; 2. by position via ``.iloc`` <[http://pandas.pydata.org/pandas-docs/stable/user\\_guide/indexing.html#selection-by-position](http://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#selection-by-position)>‘`_`.

```
[11]: # view the surface fraction variable: `sfr`
df_state_init.loc[:, 'sfr']

[11]: ind_dim  (0,)  (1,)  (2,)  (3,)  (4,)  (5,)  (6,)
      grid
      98      0.43  0.38  0.001  0.019  0.029  0.001  0.14
```

```
[12]: # view the second row of `df_forcing`, which is a pandas Series
df_forcing.iloc[1]

[12]: iy      2012.000000
       id      1.000000
       it      0.000000
       imin     10.000000
       qn     -999.000000
       qh     -999.000000
       qe     -999.000000
       qs     -999.000000
       qf     -999.000000
       U      4.515000
       RH     85.463333

       kdiff   -999.000000
       kdir    -999.000000
       wdir    -999.000000
```

(continues on next page)

(continued from previous page)

```
isec      0.000000
Name: 2012-01-01 00:10:00, dtype: float64
```

[13]: # view a particular position of `df\_forcing`, which is a value  
df\_forcing.iloc[8,9]

[13]: 4.455

## setting new values

Setting new values is very straightforward: after locating the variables/data to modify, just set the new values accordingly:

[14]: # modify surface fractions  
df\_state\_init.loc[:, 'sfr']=[.1,.1,.2,.3,.25,.05,0]  
# check the updated values  
df\_state\_init.loc[:, 'sfr']

[14]:

ind_dim	(0,)	(1,)	(2,)	(3,)	(4,)	(5,)	(6,)	
grid	98	0.1	0.1	0.2	0.3	0.25	0.05	0.0

## 1.1.2 Run simulations

Once met-forcing (via df\_forcing) and initial conditions (via df\_state\_init) are loaded in, we call sp.run\_supy to conduct a SUEWS simulation, which will return two pandas DataFrames: df\_output and df\_state.

[15]: df\_output, df\_state\_final = sp.run\_supy(df\_forcing, df\_state\_init)

```
INFO:root:=====
INFO:root:Simulation period:
INFO:root: Start: 2012-01-01 00:05:00
INFO:root: End: 2013-01-01 00:00:00
INFO:root:
INFO:root:No. of grids: 1
INFO:root:SuPy is running in serial mode
INFO:root:Execution time: 3.2 s
INFO:root:=====
```

## df\_output

df\_output is an ensemble output collection of major SUEWS output groups, including:

- SUEWS: the essential SUEWS output variables
- DailyState: variables of daily state information
- snow: snow output variables (effective when snowuse = 1 set in df\_state\_init)

Detailed description of variables in df\_output refers to [SuPy output](#)

```
[16]: df_output.columns.levels[0]
[16]: Index(['SUEWS', 'snow', 'RSL', 'DailyState'], dtype='object', name='group')
```

**df\_state\_final**

`df_state_final` is a DataFrame for holding:

1. all model states if `save_state` is set to `True` when calling `sp.run_supy` and `supy` may run significantly slower for a large simulation;
2. or, only the final state if `save_state` is set to `False` (the default setting) in which mode `supy` has a similar performance as the standalone compiled SUEWS executable.

Entries in `df_state_final` have the same data structure as `df_state_init` and can thus be used for other SUEWS simulations starting at the timestamp as in `df_state_final`.

Detailed description of variables in `df_state_final` refers to [SuPy output](#)

```
[17]: df_state_final.T.head()
[17]:
```

	datetime	2012-01-01 00:05:00	2013-01-01 00:05:00
grid		98	98
var	ind_dim		
ah_min	(0,)	15.0	15.0
	(1,)	15.0	15.0
ah_slope_cooling	(0,)	2.7	2.7
	(1,)	2.7	2.7
ah_slope_heating	(0,)	2.7	2.7

### 1.1.3 Examine results

Thanks to the functionality inherited from `pandas` and other packages under the [PyData](#) stack, compared with the standard SUEWS simulation workflow, `supy` enables more convenient examination of SUEWS results by statistics calculation, resampling, plotting (and many more).

#### Ouptut structure

`df_output` is organised with `MultiIndex` (`grid,timestamp`) and (`group,varaible`) as `index` and `columns`, respectively.

```
[18]: df_output.head()
[18]:
```

group	SUEWS	\				
var	Kdown	Kup	Ldown	Lup		
grid	datetime					
98	2012-01-01 00:05:00	0.153333	0.021237	344.310184	372.417244	\

    2012-01-01 00:25:00  NaN

[5 rows x 340 columns]

```

Here we demonstrate several typical scenarios for SUEWS results examination.

The essential SUEWS output collection is extracted as a separate variable for easier processing in the following sections. More [advanced slicing techniques](#) are available in `pandas` documentation.

```
[19]: df_output_suews = df_output['SUEWS']
```

## Statistics Calculation

We can use `.describe()` method for a quick overview of the key surface energy balance budgets.

```
[20]: df_output_suews.loc[:, ['QN', 'QS', 'QH', 'QE', 'QF']].describe()

[20]: var QN QS QH QE \
count 105408.000000 105408.000000 105408.000000 105408.000000 \

50% 82.815455
75% 104.577731
max 162.947824
```

## Plotting

### Basic example

Plotting is very straightforward via the `.plot` method bounded with `pandas.DataFrame`. Note the usage of `loc` for to slices of the output DataFrame.

```
[21]: # a dict for better display variable names
dict_var_disp = {
    'QN': '$Q^*$',
    'QS': r'$\Delta Q_S$',
    'QE': '$Q_E$',
    'QH': '$Q_H$',
    'QF': '$Q_F$',
    'Kdown': r'$K_{\downarrow}$',
    'Kup': r'$K_{\uparrow}$',
    'Ldown': r'$L_{\downarrow}$',
    'Lup': r'$L_{\uparrow}$',
    'Rain': '$P$',
    'Irr': '$I$',
    'Evap': '$E$',
    'RO': '$R$',
    'TotCh': '$\Delta S$',
}
```

Quick look at the simulation results:

```
[22]: ax_output = df_output_suews\
    .loc[grid]\\
    .loc['2012 6 1':'2012 6 7',\
        ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\\
    .plot()
ax_output.set_xlabel('Date')
```

(continues on next page)

(continued from previous page)

```
[22]: ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')
ax_output.legend()
<matplotlib.legend.Legend at 0x7f8ec14566a0>
```

## More examples

Below is a more complete example for examination of urban energy balance over the whole summer (June to August).

```
[23]: # energy balance
ax_output = df_output_suews.loc[grid]\n    .loc['2012 6':'2012 8', ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\n    .plot(\n        figsize=(10, 3),\n        title='Surface Energy Balance',\n    )\nax_output.set_xlabel('Date')\nax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')\nax_output.legend()\n<matplotlib.legend.Legend at 0x7f8ed08c3278>
```

## Resampling

The suggested runtime/simulation frequency of SUEWS is 300 s, which usually results a large output and may be over-weighted for storage and analysis. Also, you may feel apparent slowdown in producing the above figure as a large amount of data were used for the plotting. To slim down the result size for analysis and output, we can resample the default output very easily.

```
[24]: rsmp_1d = df_output_suews.loc[grid].resample('1d')\n# daily mean values\ndf_1d_mean = rsmp_1d.mean()\n# daily sum values\ndf_1d_sum = rsmp_1d.sum()
```

We can then re-examine the above energy balance at hourly scale and plotting will be significantly faster.

```
[25]: # energy balance
ax_output = df_1d_mean\
    .loc[:, ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\n    .plot(\n        figsize=(10, 3),\n        title='Surface Energy Balance',\n    )\nax_output.set_xlabel('Date')\nax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')\nax_output.legend()\n<matplotlib.legend.Legend at 0x7f8ec1623908>
```

Then we use the hourly results for other analyses.

```
[26]: # radiation balance
ax_output = df_1d_mean\
    .loc[:, ['QN', 'Kdown', 'Kup', 'Ldown', 'Lup']]\
    .rename(columns=dict_var_disp)\\
    .plot(
        figsize=(10, 3),
        title='Radiation Balance',
    )
ax_output.set_xlabel('Date')
ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')
ax_output.legend()

[26]: <matplotlib.legend.Legend at 0x7f8eb149a0b8>
```

```
[27]: # water balance
ax_output = df_1d_sum\
    .loc[:, ['Rain', 'Irr', 'Evap', 'RO', 'TotCh']]\
    .rename(columns=dict_var_disp)\\
    .plot(
        figsize=(10, 3),
        title='Surface Water Balance',
    )
ax_output.set_xlabel('Date')
ax_output.set_ylabel('Water amount (mm)')
ax_output.legend()

[27]: <matplotlib.legend.Legend at 0x7f8ef208bc18>
```

Get an overview of partitioning in energy and water balance at monthly scales:

```
[28]: # get a monthly Resampler
df_plot=df_output_suews.loc[grid].copy()
df_plot.index=df_plot.index.set_names('Month')
rsmp_1M = df_plot\
    .shift(-1)\ 
    .dropna(how='all')\
    .resample('1M', kind='period')
# mean values
df_1M_mean = rsmp_1M.mean()
# sum values
df_1M_sum = rsmp_1M.sum()
```

```
[29]: # month names
name_mon = [x.strftime('%b') for x in rsmp_1M.groups]
# create subplots showing two panels together
fig, axes = plt.subplots(2, 1, sharex=True)
# surface energy balance
df_1M_mean\
    .loc[:, ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\\
    .plot(
        ax=axes[0], # specify the axis for plotting
        figsize=(10, 6), # specify figure size
        title='Surface Energy Balance',
        kind='bar',
```

(continues on next page)

(continued from previous page)

```

        )
# surface water balance
df_1M_sum\ 
    .loc[:, ['Rain', 'Irr', 'Evap', 'RO', 'TotCh']]\
    .rename(columns=dict_var_disp)\ 
    .plot(
        ax=axes[1], # specify the axis for plotting
        title='Surface Water Balance',
        kind='bar'
    )

# annotations
axes[0].set_ylabel('Mean Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')
axes[0].legend()
axes[1].set_xlabel('Month')
axes[1].set_ylabel('Total Water Amount (mm)')
axes[1].xaxis.set_ticklabels(name_mon, rotation=0)
axes[1].legend()

[29]: <matplotlib.legend.Legend at 0x7f8ec195a9b0>

```

## Output

The supy output can be saved as `txt` files for further analysis using supy function `save_supy`.

```
[30]: list_path_save = sp.save_supy(df_output, df_state_final, path_runcontrol=path_
    ↪runcontrol)
```

```
[31]: for file_out in list_path_save:
    print(file_out.name)

The following section was generated from `docs/source/tutorial/impact-studies-parallel.ipynb`

## 1.2 Impact Studies Using SuPy

### 1.2.1 Aim

In this tutorial, we aim to perform sensitivity analysis using supy in a parallel mode to investigate the impacts on urban climate of

1. surface properties: the physical attributes of land covers (e.g., albedo, water holding capacity, etc.)

2. background climate: longterm meteorological conditions (e.g., air temperature, precipitation, etc.)

## 1.2.2 Prepare supy for the parallel mode

### load supy and sample dataset

```
[1]: from dask import delayed
from dask import dataframe as dd
import os
import supy as sp
import seaborn as sns
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.dates as mdates
from time import time
import logging
logging.basicConfig()
logging.getLogger().setLevel(logging.WARNING)

get_ipython().run_line_magic('matplotlib', 'inline')
# produce high-quality figures, which can also be set as one of ['svg', 'pdf', 'retina'
# 'png']
# 'svg' produces high quality vector figures
%config InlineBackend.figure_format = 'svg'
# show supy version info
sp.show_version()

supy: 2019.8.30dev
supy_driver: 2019a4
```

```
[2]: # load sample datasets
df_state_init, df_forcing = sp.load_SampleData()
# perform an example run to get output samples for later use
df_output, df_state_final = sp.run_supy(df_forcing, df_state_init)
```

### Paralell setup for supy using dask

Given the nature of impact studies that requires multiple independent models with selected parameters/variables varying across the setups, such simulations well fall into the scope of so-called *\*embarrassingly parallel computation\** that is fully supported by dask. Also, as supy is readily built on the data structure `pandas.DataFrame`, we can fairly easily transfer it to the dask framework for parallel operations thanks to ``dask.dataframe <http://docs.dask.org/en/latest/dataframe.html>``, a specialized `dataframe` extending `pandas.DataFrame`'s ability in parallel operations.

Prior to version 2019.5, for a given forcing dataset `df_forcing`, supy would loop over the grids in a `df_state_init` to conduct simulations. Since version 2019.5, supy has been using the `dask.dataframe` to gain the parallel benefits through its parallelized `apply` method.

`dask.dataframe` essentially divides the work into pieces for parallel operations. As such, depending on the number of processors in your computer, it would be more efficient to set the partition number as the multipliers of CPU numbers.

```
[3]: import platform
import psutil
list_info=['machine','system','mac_ver','processor']
for info in list_info:
    info_x=getattr(platform,info)()
    print(info,':',info_x)
cpu_count=psutil.cpu_count()
print('number of CPU processors:',cpu_count)
mem_size=psutil.virtual_memory().total/1024**3
print('memory size (GB):',mem_size)

machine : x86_64
system : Darwin
mac_ver : ('10.14.6', '', '', ''), 'x86_64')
processor : i386
number of CPU processors: 12
memory size (GB): 32.0
```

To demonstrate the parallelization, we simply duplicate the contents in `df_state_init` to make it seemingly large. Note we intentionally choose 24 as the number for copies to accompany the power of CPU.

Before we move on to the parallel mode, we perform a simulation in the traditional serial way to see the baseline performance.

### Baseline serial run

```
[4]: # just run for 30 days
df_forcing_part = df_forcing.iloc[:288*30]
df_state_init_mgrids = df_state_init.copy()
# construct a multi-grid `df_state_init`
for i in range(24-1):
    df_state_init_mgrids = df_state_init_mgrids.append(
        df_state_init, ignore_index=True)
# perform a serial run
t0 = time()
for i in range(24-1):
    xx = sp.run_supy(df_forcing_part, df_state_init_mgrids.iloc[[i]])
t1 = time()
t_ser = t1-t0
logging.warning(f'Execution time: {t_ser:.2f} s')
```

WARNING:root:Execution time: 7.61 s

### Parallel run

```
[5]: # parallel run is enabled in supy by default
t0 = time()
xx = sp.run_supy(df_forcing_part, df_state_init_mgrids)
t1 = time()
t_par = t1-t0
logging.warning(f'Execution time: {t_par:.2f} s')

WARNING:root:Execution time: 4.13 s
```

## Benchmark test

*Note: this test may take a considerably long time depending on the machine performance*

```
[6]: # different running length
list_sim_len = [
    day * 288 for day in [30, 90, 120, 150, 180, 270, 365, 365 * 2, 365 * 3]
]

# number of test grids
n_grid = 12

# construct a multi-grid `df_state_init`
df_state_init_m = df_state_init.copy()
for i in range(n_grid - 1):
    df_state_init_m = df_state_init_m.append(df_state_init, ignore_index=True)

# construct a longer`df_forcing` for three years
df_forcing_m = pd.concat([df_forcing for i in range(3)])
df_forcing_m.index = pd.date_range(df_forcing.index[0],
                                    freq=df_forcing.index.freq,
                                    periods=df_forcing_m.index.size)

dict_time_ser = dict()
dict_time_par = dict()
for sim_len in list_sim_len:
    df_forcing_part = df_forcing_m.iloc[:sim_len]
    logging.warning(f'Sim days: {sim_len / 288}')

```

### 1.2.3 Surface properties: surface albedo

Examine the default albedo values loaded from the sample dataset

```
[8]: df_state_init.alb
```

  

```
[8]: ind_dim  (0,)  (1,)  (2,)  (3,)  (4,)  (5,)  (6,)
grid
98        0.12  0.15  0.12  0.18  0.21  0.21  0.1
```

Copy the initial condition DataFrame to have a *clean slate* for our study

Note: DataFrame.copy() defaults to deepcopy

```
[9]: df_state_init_test = df_state_init.copy()
```

Set the Bldg land cover to 100% for this study

```
[10]: df_state_init_test.sfr = 0
df_state_init_test.loc[:, ('sfr', '(1,))'] = 1
df_state_init_test.sfr
```

```
[10]: ind_dim  (0,)  (1,)  (2,)  (3,)  (4,)  (5,)  (6,)
grid
98          0      1      0      0      0      0      0
```

### Construct a `df_state_init_x` dataframe to perform `supy` simulation with specified albedo

```
[11]: # create a `df_state_init_x` with different surface properties
n_test = 48
list_alb_test = np.linspace(0.1, 0.8, n_test).round(2)
df_state_init_x = df_state_init_test.append(
    [df_state_init_test]*(n_test-1), ignore_index=True)

# here we modify surface albedo
df_state_init_x.loc[:, ('alb', '(1,)')] = list_alb_test
```

### Conduct simulations with `supy`

```
[12]: df_forcing_part = df_forcing.loc['2012 01':'2012 07']
df_res_alb_test, df_state_final_x = sp.run_supy(df_forcing_part, df_state_init_x)
```

### Examine the simulation results

```
[13]: # choose results of July 2012 for analysis
df_res_alb_test_july=df_res_alb_test.SUEWS.unstack(0).loc['2012 7']
df_res_alb_T2_stat = df_res_alb_test_july.T2.describe()
df_res_alb_T2_diff = df_res_alb_T2_stat.transform(
    lambda x: x - df_res_alb_T2_stat.iloc[:, 0])
df_res_alb_T2_diff.columns = list_alb_test-list_alb_test[0]
```

```
[14]: ax_temp_diff = df_res_alb_T2_diff.loc[['max', 'mean', 'min']].T.plot()
ax_temp_diff.set_ylabel('$\Delta T_2$ ($^\circ C$)')
ax_temp_diff.set_xlabel(r'$\Delta \alpha$')
ax_temp_diff.margins(x=0.2, y=0.2)
```

### Why a bi-linear $\Delta\alpha - \Delta T_{2,max}$ relationship?

Although the relations for mean and minimum  $T_2$  demonstrate single linear patterns, the one for maximum  $T_2$ , interestingly, consists of two linear sections.

```
[15]: df_t2=df_res_alb_test_july.T2
df_t2.columns=list_alb_test

df_t2.idxmax().unique()

[15]: array(['2012-07-25T13:35:00.000000000', '2012-07-25T15:30:00.000000000'],
           dtype='datetime64[ns]')
```

By looking into the peaking times of  $T_{2,max}$ , we see a shift in the peaking times from 13:35 to 15:30 on 2012-07-25 as albedo increases. Taking the two ending cases,  $\alpha = 0.1$  and  $\alpha = 0.8$ , we see diurnal cycles of  $T_2$  evolves according to the albedo: peak is delayed as albedo increases.

```
[16]: df_t2.loc['2012-07-25'].iloc[:, [0, -1]].plot()
[16]: <matplotlib.axes._subplots.AxesSubplot at 0x7f9630da73c8>
```

Furthermore, when the  $\Delta\alpha - \Delta T_2$  relations at the two peaking times are shown below, we can see the bi-linear relation based on the  $T_{2,max}$  values for the July 2012 is actually composed of two linear relations at different times under different peaking scenarios.

```
[17]: ax_t2_max=df_t2.loc['2012-07-25 13:35':'2012-07-25 15:30'].iloc[[0, -1]].T.plot()
ax_t2_max.set_xlabel(r'$\alpha$')
ax_t2_max.set_ylabel('T_{2,max} ($^\circ C')')

[17]: Text(0, 0.5, 'T_{2,max} ($^\circ C')')
```

## 1.2.4 Background climate: air temperature

### Examine the monthly climatology of air temperature loaded from the sample dataset

```
[18]: df_plot = df_forcing.Tair.iloc[:-1].resample('1m').mean()
ax_temp = df_plot.plot.bar(color='tab:blue')
ax_temp.set_xticklabels(df_plot.index.strftime('%b'))
ax_temp.set_ylabel('Mean Air Temperature ($^\circ C)')
ax_temp.set_xlabel('Month')
ax_temp

[18]: <matplotlib.axes._subplots.AxesSubplot at 0x7f9630d7f668>
```

**Construct a function to perform parallel supy simulation with specified diff\_airtemp\_test: the difference in air temperature between the one used in simulation and loaded from sample dataset.**

*Note: forcing data “df\_forcing“ has different data structure from “df\_state\_init“; so we need to modify “run\_supy\_mgrids“ to implement a “run\_supy\_mcclims“ for different climate scenarios*

Let’s start the implementation of run\_supy\_mcclims with a small problem of four forcing groups (i.e., climate scenarios), where the air temperatures differ from the baseline scenario with a constant bias.

```
[19]: # save loaded sample datasets
df_forcing_part_test = df_forcing.loc['2012 1':'2012 7'].copy()
df_state_init_test = df_state_init.copy()
```

```
[20]: # create a dict with four forcing conditions as a test
n_test = 4
list_TairDiff_test = np.linspace(0., 2, n_test).round(2)
dict_df_forcing_x = {
    tairdiff: df_forcing_part_test.copy()
    for tairdiff in list_TairDiff_test}
for tairdiff in dict_df_forcing_x:
```

(continues on next page)

(continued from previous page)

```

dict_df_forcing_x[tairdiff].loc[:, 'Tair'] += tairdiff

dd_forcing_x = {
    k: delayed(sp.run_supy)(df, df_state_init_test)[0]
    for k, df in dict_df_forcing_x.items()
}

df_res_tairdiff_test0 = delayed(pd.concat)(
    dd_forcing_x,
    keys=list_TairDiff_test,
    names=['tairdiff'],
)

```

```
[21]: # test the performance of a parallel run
t0 = time()
df_res_tairdiff_test = df_res_tairdiff_test0\
    .compute(scheduler='threads')\
    .reset_index('grid', drop=True)
t1 = time()
t_par = t1 - t0
print(f'Execution time: {t_par:.2f} s')

Execution time: 6.83 s
```

```
[22]: # function for multi-climate `run_supy`
# wrapping the above code into one
def run_supy_mclims(df_state_init, dict_df_forcing_mclims):
    dd_forcing_x = {
        k: delayed(sp.run_supy)(df, df_state_init_test)[0]
        for k, df in dict_df_forcing_x.items()
    }
    df_output_mclims0 = delayed(pd.concat)(
        dd_forcing_x,
        keys=list(dict_df_forcing_x.keys()),
        names=['clm'],
    ).compute(scheduler='threads')
    df_output_mclims = df_output_mclims0.reset_index('grid', drop=True)

    return df_output_mclims
```

## Construct `dict_df_forcing_x` with multiple forcing DataFrames

```
[23]: # save loaded sample datasets
df_forcing_part_test = df_forcing.loc['2012 1':'2012 7'].copy()
df_state_init_test = df_state_init.copy()

# create a dict with a number of forcing conditions
n_test = 24 # can be set with a smaller value to save simulation time
list_TairDiff_test = np.linspace(0., 2, n_test).round(2)
dict_df_forcing_x = {
    tairdiff: df_forcing_part_test.copy()
    for tairdiff in list_TairDiff_test}
for tairdiff in dict_df_forcing_x:
    dict_df_forcing_x[tairdiff].loc[:, 'Tair'] += tairdiff
```

## Perform simulations

```
[24]: # run parallel simulations using `run_supy_mcclims`  
t0 = time()  
df_airtemp_test_x = run_supy_mcclims(df_state_init_test, dict_df_forcing_x)  
t1 = time()  
t_par = t1-t0  
print(f'Execution time: {t_par:.2f} s')  
  
Execution time: 38.52 s
```

## Examine the results

```
[25]: df_airtemp_test = df_airtemp_test_x.SUEWS.unstack(0)  
df_temp_diff=df_airtemp_test.T2.transform(lambda x: x - df_airtemp_test.T2[0.0])  
df_temp_diff_ana=df_temp_diff.loc['2012 7']  
df_temp_diff_stat=df_temp_diff_ana.describe().loc[['max', 'mean', 'min']].T  
  
[26]: ax_temp_diff_stat=df_temp_diff_stat.plot()  
ax_temp_diff_stat.set_ylabel('$\Delta T_2$ ($^\circ C$)')  
ax_temp_diff_stat.set_xlabel('$\Delta T_a$ ($^\circ C$)')  
ax_temp_diff_stat.set_aspect('equal')
```

The  $T_2$  results indicate the increased  $T_a$  has different impacts on the  $T_2$  metrics (minimum, mean and maximum) but all increase linearly with  $T_a$ . The maximum  $T_2$  has the stronger response compared to the other metrics.

## 1.3 Interaction between SuPy and external models

### 1.3.1 Introduction

SUEWS can be coupled to other models that provide or require forcing data using the SuPy single timestep running mode. We demonstrate this feature with a simple online anthropogenic heat flux model.

Anthropogenic heat flux ( $Q_F$ ) is an additional term to the surface energy balance in urban areas associated with human activities (Gabey et al., 2018; Grimmond, 1992; Nie et al., 2014; 2016; Sailor, 2011). In most cities, the largest emission source is from buildings (Hamilton et al., 2009; Iamarino et al., 2011; Sailor, 2011) and is highly dependent on outdoor ambient air temperature.

#### load necessary packages

```
[1]: import supy as sp  
import pandas as pd  
import numpy as np  
import matplotlib.pyplot as plt  
import matplotlib.dates as mdates  
import seaborn as sns
```

(continues on next page)

(continued from previous page)

```
%matplotlib inline
# produce high-quality figures, which can also be set as one of ['svg', 'pdf', 'retina'
# 'png']
# 'svg' produces high quality vector figures
from IPython.display import set_matplotlib_formats
set_matplotlib_formats('svg')
sp.show_version()

supy: 2019.8.30dev
supy_driver: 2019a4
```

## run SUEWS with default settings

```
[2]: # load sample run dataset
df_state_init, df_forcing = sp.load_SampleData()
df_state_init_def=df_state_init.copy()
# set QF as zero for later comparison
df_forcing_def=df_forcing.copy()
grid=df_state_init_def.index[0]
df_state_init_def.loc[:, 'emissionsmethod']=0
df_forcing_def['qf']=0
# run supy
df_output, df_state = sp.run_supy(df_forcing_def, df_state_init_def)
df_output_def = df_output.loc[grid, 'SUEWS']

### 1.3.2 a simple QF model: QF\_simple

## model description

For demonstration purposes we have created a very simple model instead of using the SUEWS  $Q_F$  (Järvi et al. 2011) with feedback from outdoor air temperature. The simple  $Q_F$  model considers only building heating and cooling:

$$Q_F = \begin{cases} (T_2 - T_C) \times C_B, & T_2 > T_C \\ (T_H - T_2) \times H_B, & T_2 < T_H \\ Q_{F0} & \end{cases}$$

where  $T_C$  ( $T_H$ ) is the cooling (heating) threshold temperature of buildings,  $C_B$  ( $H_B$ ) is the building cooling (heating) rate, and  $Q_{F0}$  is the baseline anthropogenic heat. The parameters used are:  $T_C$  ( $T_H$ ) set as 20 °C (10 °C),  $C_B$  ( $H_B$ ) set as 1.5 W m<sup>-2</sup> K<sup>-1</sup> (3 W m<sup>-2</sup> K<sup>-1</sup>) and  $Q_{F0}$  is set as 0 W m<sup>-2</sup>, implying other building activities (e.g. lightning, water heating, computers) are zero and therefore do not change the temperature or change with temperature.

## implementation

```
[4]: def QF_simple(T2):
    qf_cooling = (T2-20)*5 if T2 > 20 else 0
    qf_heating = (10-T2)*10 if T2 < 10 else 0
    qf_res = np.max([qf_heating, qf_cooling])*0.3
    return qf_res
```

Visualise the QF\_simple model:

```
[6]: ser_temp = pd.Series(np.arange(-5, 45, 0.5),
                       index=np.arange(-5, 45, 0.5)).rename('temp_C')
ser_qf_heating = ser_temp.loc[-5:10].map(QF_simple).rename(
    r'heating: $(T_H-T_a) \times H_B$')
ser_qf_cooling = ser_temp.loc[20:45].map(QF_simple).rename(
    r'cooling: $(T_a-T_C) \times C_B$')
ser_qf_zero = ser_temp.loc[10:20].map(QF_simple).rename('baseline: $Q_{F0}$')
df_temp_qf = pd.concat([ser_temp, ser_qf_cooling, ser_qf_heating, ser_qf_zero],
                       axis=1).set_index('temp_C')
ax_qf_func = df_temp_qf.plot()
ax_qf_func.set_xlabel(r'$T_2$ ($^\circ\text{C}$)')
ax_qf_func.set_ylabel(r'$Q_F$ (W m$^{-2}$)')
ax_qf_func.legend(title='simple $Q_F$')
ax_qf_func.annotate(
    "$T_C$",
    xy=(20, 0),
    xycoords='data',
    xytext=(25, 5),
    textcoords='data',
    arrowprops=dict(
        arrowstyle="->",
        color="0.5",
        shrinkA=5,
        shrinkB=5,
        patchA=None,
        patchB=None,
        connectionstyle='arc3',
    ),
)
ax_qf_func.annotate(
    "$T_H$",
)
```

(continues on next page)

(continued from previous page)

```

xy=(10, 0),

        patchA=None,
        patchB=None,
        connectionstyle='arc3, rad=-0.3',
),
)
ax_qf_func.plot(10, 0, 'o', color='C1', fillstyle='none')
= ax_qf_func.plot(20, 0, 'o', color='C0', fillstyle='none')

```

### 1.3.3 communication between supy and QF\_simple

#### construct a new coupled function

The coupling between the simple  $Q_F$  model and SuPy is done via the low-level function `suews_cal_tstep`, which is an interface function in charge of communications between SuPy frontend and the calculation kernel. By setting

SuPy to receive external  $Q_F$  as forcing, at each timestep, the simple  $Q_F$  model is driven by the SuPy output  $T_2$  and provides SuPy with  $Q_F$ , which thus forms a two-way coupled loop.

```
[7]: # load extra low-level functions from supy to construct interactive functions
from supy._post import pack_df_output, pack_df_state
from supy._run import suews_cal_tstep, pack_grid_dict

def run_supy_qf(df_forcing_test, df_state_init_test):
    grid = df_state_init_test.index[0]
    df_state_init_test.loc[grid, 'emissionsmethod'] = 0

    df_forcing_test = df_forcing_test\
        .assign(
            metforcingdata_grid=0,
            ts5mindata_ir=0,
        )\
        .rename(
            # remanae is a workaround to resolve naming inconsistency between
            # suews fortran code interface and input forcing file headers
            columns={
                '%' + 'iy': 'iy',

return df_output_test.loc[grid, 'SUEWS'], df_state_test

```

## simulations for summer and winter months

The simulation using SuPy coupled is performed for London 2012. The data analysed are a summer (July) and a winter (December) month. Initially  $Q_F$  is 0 W m<sup>-2</sup> the  $T_2$  is determined and used to determine  $Q_{F[1]}$  which in turn modifies  $T_{2[1]}$  and therefore modifies  $Q_{F[2]}$  and the diagnosed  $T_{2[2]}$ .

### spin-up run (January to June) for summer simulation

```

```

### comparison in $\Delta Q_F$ - $\Delta T_2$ feedback between summer and winter

```
[15]: # filter results using `where` to choose periods when `QF_simple` is effective
# (i.e. activated by outdoor air temperatures)
df_diff_summer = (df_output_test_summer - df_output_def) \
    .where(df_output_def.T2 > 20, np.nan) \
    .dropna(how='all', axis=0)
df_diff_winter = (df_output_test_winter - df_output_def) \
    .where(df_output_test_winter.T2 < 10, np.nan) \
    .dropna(how='all', axis=0)

set_matplotlib_formats('svg')
# set_matplotlib_formats('retina')
df_diff_season = pd.concat([
    df_diff_winter.assign(season='winter'),
    df_diff_summer.assign(season='summer'),
]).loc[:, ['season', 'QF', 'T2']]
g = sns.lmplot(
    data=df_diff_season,
    x='QF',
    y='T2',
    hue='season',
    height=4,
    truncate=False,
    markers='o',
    legend_out=False,
    scatter_kws={
        's': 1,
        'zorder': 0,
        'alpha': 0.8,
    },
    line_kws={
        'zorder': 6,
        'linestyle': '--'
    },
)
g.set_axis_labels(
    '$\Delta Q_F$ ($ \mathrm{W} \cdot \mathrm{m}^{-2} )$',
    '$\Delta T_2$ ($^\circ\mathrm{C}$)'
)
g.ax.legend(markerscale=4)
g.despine(top=False, right=False)
[15]: <seaborn.axisgrid.FacetGrid at 0x7fa35b350748>
```

The above figure indicate a positive feedback, as  $Q_F$  is increased there is an elevated  $T_2$  but with different magnitudes given the non-linearity in the SUEWS modelling system. Of particular note is the positive feedback loop under warm air temperatures: the anthropogenic heat emissions increase which in turn elevates the outdoor air temperature causing yet more anthropogenic heat release. Note that London is relatively cool so the enhancement is much less than it would be in warmer cities.

---

**Note:**

1. The Anaconda distribution is suggested as the scientific Python 3 environment for its completeness in necessary packages. Please follow the official guide for its [installation](#).
  2. Users with less experience in Python are suggested to go through the following section first before using SuPy.
- 

## 1.4 Python 101 before SuPy

Admittedly, this header is somewhat misleading: given the enormity of Python, it's more challenging to get this section *correct* than coding SuPy per se. As such, here a collection of data analysis oriented links to useful Python resources is provided to help novices start using Python and **then** SuPy.

- [The gist of Python](#): a quick introductory blog that covers Python basics for data analysis.
- Jupyter Notebook: Jupyter Notebook provides a powerful notebook-based data analysis environment that SuPy users are strongly encouraged to use. Jupyter notebooks can run in browsers (desktop, mobile) either by easy local configuration or on remote servers with pre-set environments (e.g., [Google Colaboratory](#), [Microsoft Azure Notebooks](#)). In addition, Jupyter notebooks allow great shareability by incorporating source code and detailed notes in one place, which helps users to organise their computation work.

- Installation

Jupyter notebooks can be installed with pip on any desktop/server system and open .ipynb notebook files locally:

```
python3 -m pip install jupyter -U
```

- Extensions: To empower your Jupyter Notebook environment with better productivity, please check out the [Unofficial Jupyter Notebook Extensions](#). Quick introductory blogs can be found [here](#) and [here](#).
- pandas: [pandas](#) is heavily used in SuPy and thus better understanding of pandas is essential in SuPy workflows.
  - Introductory blogs:
    - \* [Quick dive into Pandas for Data Science](#): introduction to pandas.
    - \* [Basic Time Series Manipulation with Pandas](#): pandas-based time series manipulation.
    - \* [Introduction to Data Visualization in Python](#): plotting using pandas and related libraries.
  - A detailed tutorial in Jupyter Notebooks:
    - \* [Introduction to pandas](#)
    - \* [pandas fundamentals](#)
    - \* [Data Wrangling with pandas](#)

## Key IO Data Structures in SuPy

---

### 2.1 Introduction

The cell below demonstrates a minimal case of SuPy simulation with all key IO data structures included:

```
[1]: import supy as sp
df_state_init, df_forcing = sp.load_SampleData()
df_output, df_state_final = sp.run_supy(df_forcing, df_state_init)
```

- Input: SuPy requires two DataFrames to perform a simulation, which are:
  - `df_state_init`: model initial states;
  - `df_forcing`: forcing data.

These input data can be loaded either through calling `load_SampleData()` as shown above or using `init_supy`. Or, based on the loaded sample DataFrames, you can modify the content to create new DataFrames for your specific needs.

- Output: The output data by SuPy consists of two DataFrames:
  - `df_output`: model output results; this is usually the basis for scientific analysis.
  - `df_state_final`: model final states; any of its entries can be used as a `df_state_init` to start another SuPy simulation.

### 2.2 Input

#### 2.2.1 `df_state_init`: model initial states

```
[2]: df_state_init.head()
```

```

```

`df_state_init` is organised with **\*grids\*** in **rows** and **\*their states\*** in **columns**. The details of all state variables can be found in [the description page](#).

Please note the properties are stored as *flattened values* to fit into the tabular format due to the nature of `DataFrame` though they may actually be of higher dimension (e.g. `ahprof_24hr` with the dimension {24, 2}). To indicate the variable dimensionality of these properties, SuPy use the `ind_dim` level in columns for indices of values:

- 0 for scalars;
- (`ind_dim1`, `ind_dim2`, ...) for arrays (for a generic sense, vectors are 1D arrays).

Take `ohm_coef` below for example, it has a dimension of {8, 4, 3} according to [the description](#), which implies the actual values used by SuPy in simulations are passed in a layout as an array of the dimension {8, 4, 3}. As such, to get proper values passed in, users should follow the dimensionality requirement to prepare/modify `df_state_init`.

```
[3]: df_state_init.loc[:, 'ohm_coef']

[3]: ind_dim  (0, 0, 0)  (0, 0, 1)  (0, 0, 2)  (0, 1, 0)  (0, 1, 1)  (0, 1, 2)  \

## 2.2.2 df\_forcing: forcing data

df\_forcing is organised with **\*temporal records\*** in **rows** and **\*forcing variables\*** in **columns**. The details of all forcing variables can be found in [the description page](#).

The missing values can be specified with -999s, which are the default NaNs accepted by SuPy and its backend SUEWS.

[4] : df\_forcing.head()

```

### Note:

The index of df\_forcing **SHOULD BE** strictly of DatetimeIndex type if you want create a df\_forcing for SuPy simulation. The SuPy runtime time-step size is instructed by the df\_forcing with its index information.

The infomation below indicates SuPy will run at a 5 min (i.e. 300 s) time-step if driven by this specific df\_forcing:

[5] : freq\_forcing=df\_forcing.index.freq  
freq\_forcing

[5]: <300 \* Seconds>

## 2.3 Output

### 2.3.1 df\_output: model output results

df\_output is organised with **\*temporal records of grids\*** in **rows** and **\*output variables of different groups\*** in **columns**. The details of all forcing variables can be found in [the description page](#).

```

`df_output` are recorded at the same temporal resolution as `df_forcing`:

```
[7]: freq_out = df_output.index.levels[1].freq
(freq_out, freq_out == freq_forcing)

[7]: (<300 * Seconds>, True)
```

### 2.3.2 `df_state_final`: model final states

`df_state_final` has the identical data structure as `df_state_init` except for the extra level `datetime` in index, which stores the temporal information associated with model states. Such structure can facilitate the reuse of it as initial model states for other simulations (e.g., diagnostics of runtime model states with `save_state=True` set in `run_supy`; or simply using it as the initial conditions for future simulations starting at the ending times of previous runs).

The meanings of state variables in `df_state_final` can be found in [the description page](#).

```

## API reference

---

### 3.1 Top-level Functions

<code>init_supy(path_init[, force_reload, check_input])</code>	Initialise supy by loading initial model states.
<code>load_forcing_grid(path_runcontrol, grid[, ...])</code>	Load forcing data for a specific grid included in the index of <code>df_state_init</code> .
<code>run_supy(df_forcing, df_state_init[, ...])</code>	Perform supy simulation.
<code>save_supy(df_output, df_state_final, freq_s, ...)</code>	Save SuPy run results to files
<code>load_SampleData()</code>	Load sample data for quickly starting a demo run.
<code>show_version()</code>	print <code>SuPy</code> and <code>supy_driver</code> version information.

#### 3.1.1 `supy.init_supy`

`supy.init_supy(path_init: str, force_reload=True, check_input=False) → pandas.core.frame.DataFrame`  
Initialise supy by loading initial model states.

##### Parameters

- **`path_init (str)`** –

**Path to a file that can initialise SuPy, which can be either of the follows:**

- SUEWS `RunControl.nml`: a namelist file for SUEWS configurations
- SuPy `df_state.csv`: a CSV file including model states produced by a SuPy run via `supy.save_supy()`

- **`force_reload (boolean, optional)`** – Flag to force reload all initialisation files by clearing all cached states, with default value `True` (i.e., force reload all files). Note: If the number of simulation grids is large (e.g., > 100), `force_reload=False` is strongly recommended for better performance.

**Returns** `df_state_init` – Initial model states. See `df_state variables` for details.

**Return type** `pandas.DataFrame`

## Examples

1. Use `RunControl.nml` to initialise SuPy

```
>>> path_init = "~/SUEWS_sims/RunControl.nml"
>>> df_state_init = supy.init_supy(path_init)
```

2. Use `df_state.csv` to initialise SuPy

```
>>> path_init = "~/SuPy_res/df_state_test.csv"
>>> df_state_init = supy.init_supy(path_init)
```

### 3.1.2 `supy.load_forcing_grid`

`supy.load_forcing_grid(path_runcontrol: str, grid: int, check_input=False) → pandas.core.frame.DataFrame`  
Load forcing data for a specific grid included in the index of `df_state_init`.

#### Parameters

- `path_runcontrol (str)` – Path to SUEWS `RunControl.nml`
- `grid (int)` – Grid number

**Returns** `df_forcing` – Forcing data. See [df\\_forcing variables](#) for details.

**Return type** `pandas.DataFrame`

## Examples

```
>>> path_runcontrol = "~/SUEWS_sims/RunControl.nml" # a valid path to
  ↵ `RunControl.nml`
>>> df_state_init = supy.init_supy(path_runcontrol) # get `df_state_init`
>>> grid = df_state_init.index[0] # first grid number included in `df_state_init`
>>> df_forcing = supy.load_forcing_grid(path_runcontrol, grid) # get df_forcing
```

### 3.1.3 `supy.run_supy`

`supy.run_supy(df_forcing: pandas.core.frame.DataFrame, df_state_init: pandas.core.frame.DataFrame,
 save_state=False, n_yr=10, logging_level=20, check_input=False, serial_mode=False)
 → Tuple[pandas.core.frame.DataFrame, pandas.core.frame.DataFrame]`

Perform supy simulation.

#### Parameters

- `df_forcing (pandas.DataFrame)` – forcing data for all grids in `df_state_init`.
- `df_state_init (pandas.DataFrame)` – initial model states; or a collection of model states with multiple timestamps, whose last temporal record will be used as the initial model states.
- `save_state (bool, optional)` – flag for saving model states at each time step, which can be useful in diagnosing model runtime performance or performing a restart run. (the default is False, which instructs supy not to save runtime model states).

- **n\_yr** (*int, optional*) – chunk size (n\_yr years) to split simulation periods so memory usage can be reduced. (the default is 10, which implies 10-year forcing chunks used in simulations).
- **logging\_level** (*logging level*) – one of these values [50 (CRITICAL), 40 (ERROR), 30 (WARNING), 20 (INFO), 10 (DEBUG)]. A lower value informs SuPy for more verbose logging info.
- **check\_input** (*bool, optional*) –  
**flag for checking validity of input: df\_forcing and df\_state\_init.** If set to `True`, any detected invalid input will stop SuPy simulation; a `False` flag will bypass such validation and may incur kernel error if any invalid input. *Note: such checking procedure may take some time if the input is large.* (the default is `False`, which bypasses the validation).
- serial\_mode** [*bool, optional*] If set to `True`, SuPy simulation will be conducted in serial mode; a `False` flag will try parallel simulation if possible (Windows not supported, i.e., always serial). (the default is `False`).

**Returns****df\_output, df\_state\_final –**

- **df\_output**: *output results*
- **df\_state\_final**: *final model states*

**Return type** Tuple[pandas.DataFrame, pandas.DataFrame]**Examples**

```
>>> df_output, df_state_final = supy.run_supy(df_forcing, df_state_init)
```

**3.1.4 supy.save\_supy**

`supy.save_supy(df_output: pandas.core.frame.DataFrame, df_state_final: pandas.core.frame.DataFrame, freq_s: int = 3600, site: str = "", path_dir_save: str = PosixPath('.'), path_runcontrol: str = None, save_tstep=False, logging_level=50, output_level=1, debug=False) → list`

Save SuPy run results to files

**Parameters**

- **df\_output** (`pandas.DataFrame`) – DataFrame of output
- **df\_state\_final** (`pandas.DataFrame`) – DataFrame of final model states
- **freq\_s** (*int, optional*) – Output frequency in seconds (the default is 3600, which indicates hourly output)
- **site** (*str, optional*) – Site identifier (the default is ‘’, which indicates site identifier will be left empty)
- **path\_dir\_save** (*str, optional*) – Path to directory to saving the files (the default is `Path('.)`, which indicates the current working directory)
- **path\_runcontrol** (*str, optional*) – Path to SUEWS `RunControl.nml`, which, if set, will be preferably used to derive `freq_s`, `site` and `path_dir_save`. (the default is `None`, which is unset)

- **save\_tstep** (*bool, optional*) – whether to save results in temporal resolution as in simulation (which may result very large files and slow progress), by default False.
- **logging\_level** (*logging level*) – one of these values [50 (CRITICAL), 40 (ERROR), 30 (WARNING), 20 (INFO), 10 (DEBUG)]. A lower value informs SuPy for more verbose logging info.
- **output\_level** (*integer, optional*) – option to determine selection of output variables, by default 1. Notes: 0 for all but snow-related; 1 for all; 2 for a minimal set without land cover specific information.
- **debug** (*bool, optional*) – whether to enable debug mode (e.g., writing out in serial mode, and other debug uses), by default False.

**Returns** a list of paths of saved files

**Return type** list

## Examples

1. save results of a supy run to the current working directory with default settings

```
>>> list_path_save = supy.save_supy(df_output, df_state_final)
```

2. save results according to settings in RunControl.nml

```
>>> list_path_save = supy.save_supy(df_output, df_state_final, path_runcontrol=
    ↪'path/to/RunControl.nml')
```

3. save results of a supy run at resampling frequency of 1800 s (i.e., half-hourly results) under the site code Test to a customised location ‘path/to/some/dir’

```
>>> list_path_save = supy.save_supy(df_output, df_state_final, freq_s=1800, site=
    ↪'Test', path_dir_save='path/to/some/dir')
```

## 3.1.5 supy.load\_SampleData

`supy.load_SampleData()` → Tuple[pandas.core.frame.DataFrame, pandas.core.frame.DataFrame]  
Load sample data for quickly starting a demo run.

**Returns**

**df\_state\_init, df\_forcing –**

- df\_state\_init: *initial model states*
- df\_forcing: *forcing data*

**Return type** Tuple[pandas.DataFrame, pandas.DataFrame]

## Examples

```
>>> df_state_init, df_forcing = supy.load_SampleData()
```

### 3.1.6 supy.show\_version

```
supy.show_version()
    print SuPy and supy_driver version information.
```

## 3.2 Utility Functions

### 3.2.1 EAR-5 Data Downloader

---

<code>download_era5(lat_x, lon_x, start, end[, ...])</code>	Generate ERA-5 cdsapi-based requests and download data for area of interests.
---	---

---

#### supy.util.download\_era5

```
supy.util.download_era5(lat_x: float, lon_x: float, start: str, end: str, dir_save=PosixPath('.'), grid=[0.125, 0.125], scale=0) → dict
Generate ERA-5 cdsapi-based requests and download data for area of interests.
```

##### Parameters

- **lat\_x** (`float`) – Latitude of centre at the area of interest.
- **lon\_x** (`float`) – Longitude of centre at the area of interest.
- **start** (`str`) – Any datetime-like string that can be parsed by `pandas.daterange()`.
- **end** (`str`) – Any datetime-like string that can be parsed by `pandas.daterange()`.
- **grid** (`list, optional`) – grid size used in CDS request API, by default [0.125, 0.125].
- **scale** (`int, optional`) – scaling factor that determines the area of interest (i.e., `area=grid[0]*scale`), by default 0.
- **dir\_save** (`Path or path-like string`) – path to directory for saving downloaded ERA5 netCDF files.

**Returns** key: name of downloaded file. value: CDS API request used for downloading the file named by the corresponding key.

**Return type** `dict`

### 3.2.2 Typical Meteorological Year

---

<code>gen_epw(df_output[, path_epw, ratio_dif_dir])</code>	Generate an epw file of uTMY (urbanised Typical Meteorological Year) using SUEWS simulation results
<code>read_epw(path_epw)</code>	Read in epw file as a DataFrame

---

#### supy.util.gen\_epw

```
supy.util.gen_epw(df_output: pandas.core.frame.DataFrame, path_epw=PosixPath('TMY.epw'), ratio_dif_dir=0.15) → Tuple[pandas.core.frame.DataFrame, str, pathlib.Path]
Generate an epw file of uTMY (urbanised Typical Meteorological Year) using SUEWS simulation results
```

##### Parameters

- **df\_output** (`pd.DataFrame`) – SUEWS simulation results.
- **path\_epw** (`Path, optional`) – Path to store generated epw file, by default `Path('./uTMY.epw')`
- **ratio\_dif\_dir** (`float, optional`) – Ratio between direct and diffuse solar radiation, by default 0.15

**Returns**

**df\_epw, text\_meta, path\_epw –**

- df\_epw: uTMY result
- text\_meta: meta-info text
- path\_epw: path to generated epw file

**Return type** `Tuple[pd.DataFrame, str, Path]`

## supy.util.read\_epw

`supy.util.read_epw(path_epw: pathlib.Path) → pandas.core.frame.DataFrame`

Read in epw file as a DataFrame

**Parameters** **path\_epw** (`Path`) – path to epw file

**Returns** **df\_tmy** – TMY results of epw file

**Return type** `pd.DataFrame`

### 3.2.3 Gap Filling

---

`fill_gap_all(ser_to_fill[, freq])`

Fill all gaps in a time series using data from neighbouring divisions of ‘freq’

---

## supy.util.fill\_gap\_all

`supy.util.fill_gap_all(ser_to_fill: pandas.core.series.Series, freq='1D') → pandas.core.series.Series`

Fill all gaps in a time series using data from neighbouring divisions of ‘freq’

**Parameters**

- **ser\_to\_fill** (`pd.Series`) – Time series to gap-fill
- **freq** (`str, optional`) – Frequency to identify gapped divisions, by default ‘1D’

**Returns**

- **ser\_test\_filled** (`pd.Series`) – Gap-filled time series.
- *Patterns*
- \_\_\_\_\_
- **010** (*missing data in division between others with no missing data*)
- **01** (*missing data in division after one with no missing data*)
- **10** (*division with missing data before one with no missing data*)

### 3.2.4 OHM

---

<code>derive_ohm_coef(ser_QS, ser_QN)</code>	A function to linearly fit two independant variables to a dependent one.
<code>sim_ohm(ser_qn, a1, a2, a3)</code>	Calculate QS using OHM (Objective Hysteresis Model).

---

#### `supy.util.derive_ohm_coef`

`supy.util.derive_ohm_coef(ser_QS, ser_QN)`

A function to linearly fit two independant variables to a dependent one. Input params: QS\_Ser: The dependent variable QS (Surface heat storage). Pandas Series.

QN\_Ser: The first independent variable (Net all wave radiation). Pandas Series. dt: The time interval with which the rate of change of QN is calculated. Float (hours).

Returns: a1, a2 coefficients and a3 (intercept)

#### `supy.util.sim_ohm`

`supy.util.sim_ohm(ser_qn: pandas.core.series.Series, a1: float, a2: float, a3: float) → pandas.core.series.Series`  
Calculate QS using OHM (Objective Hysteresis Model).

##### Parameters

- `ser_qn` (`pd.Series`) – net all-wave radiation.
- `a1` (`float`) – a1 of OHM coefficients.
- `a2` (`float`) – a2 of OHM coefficients.
- `a3` (`float`) – a3 of OHM coefficients.

**Returns** heat storage flux calculated by OHM.

**Return type** `pd.Series`

### 3.2.5 Surface Conductance

---

<code>cal_gs_mod(kd, ta_k, rh, pa, smd, lai, g_cst)</code>	Model surface conductance/resistance using phenology and atmospheric forcing conditions.
<code>cal_gs_obs(qh, qe, ta, rh, pa)</code>	Calculate surface conductance based on observations, notably turbulent fluxes.
<code>calib_g(df_fc_suews[, g_max, lai_max, s1, ...])</code>	Calibrate parameters for modelling surface conductance over vegetated surfaces using LMFIT.

---

#### `supy.util.cal_gs_mod`

`supy.util.cal_gs_mod(kd, ta_k, rh, pa, smd, lai, g_cst, g_max=30.0, lai_max=6.0, s1=5.56)`  
Model surface conductance/resistance using phenology and atmospheric forcing conditions.

##### Parameters

- `kd` (`numeric`) – Incoming solar radiation [W m-2]

- **ta\_k** (*numeric*) – Air temperature [K]
- **rh** (*numeric*) – Relative humidity [%]
- **pa** (*numeric*) – Air pressure
- **smd** (*numeric*) – Soil moisture deficit [mm]
- **lai** (*numeric*) – Leaf area index [ $m^2 m^{-2}$ ]
- **g\_cst** (*size=6 array*) – Parameters to determine surface conductance/resistance: g1 (LAI related), g2 (solar radiation related), g3 (humidity related), g4 (humidity related), g5 (air temperature related), g6 (soil moisture related)
- **g\_max** (*numeric, optional*) – Maximum surface conductance [mm s<sup>-1</sup>], by default 30
- **lai\_max** (*numeric, optional*) – Maximum LAI [ $m^2 m^{-2}$ ], by default 6
- **s1** (*numeric, optional*) – Wilting point (WP=s1/g6, indicated as deficit [mm]) related parameter, by default 5.56

**Returns** Modelled surface conductance [mm s<sup>-1</sup>]

**Return type** numeric

## supy.util.cal\_gs\_obs

`supy.util.cal_gs_obs(qh, qe, ta, rh, pa)`

Calculate surface conductance based on observations, notably turbulent fluxes.

### Parameters

- **qh** (*numeric*) – Sensible heat flux [ $W m^{-2}$ ]
- **qe** (*numeric*) – Latent heat flux [ $W m^{-2}$ ]
- **ta** (*numeric*) – Air temperature [K]
- **rh** (*numeric*) – Relative humidity [%]
- **pa** (*numeric*) – Air pressure [Pa]

**Returns** Surface conductance based on observations [mm s<sup>-1</sup>]

**Return type** numeric

## supy.util.calib\_g

`supy.util.calib_g(df_fc_suews, g_max=33.1, lai_max=5.9, s1=5.56, method='cobyla', prms_init=None, debug=False)`

Calibrate parameters for modelling surface conductance over vegetated surfaces using LMFIT.

### Parameters

- **df\_fc\_suews** (`pandas.DataFrame`) – DataFrame in SuPy forcing format
- **g\_max** (*numeric, optional*) – Maximum surface conductance [mm s<sup>-1</sup>], by default 30
- **lai\_max** (*numeric, optional*) – Maximum LAI [ $m^2 m^{-2}$ ], by default 6
- **s1** (*numeric, optional*) – Wilting point (WP=s1/g6, indicated as deficit [mm]) related parameter, by default 5.56

- **method** (*str*, optional) – Method used in minimisation by lmfit.minimize: details refer to its method.
- **prms\_init** (*lmfit.Parameters*) – Initial parameters for calibration
- **debug** (*bool*, optional) – Option to output final calibrated ModelResult, by default False

**Returns****dict, or ‘ModelResult <lmfit –**

1. dict: {parameter\_name -> best\_fit\_value}
2. ModelResult

**Note:** Parameters for surface conductance: g1 (LAI related), g2 (solar radiation related), g3 (humidity related), g4 (humidity related), g5 (air temperature related), g6 (soil moisture related)

**Return type** ModelResult>` if debug==True

---

**Note:** For calibration validity, turbulent fluxes, QH and QE, in df\_fc\_suews should ONLY be observations, i.e., interpolated values should be avoided. To do so, please place np.nan as missing values for QH and QE.

---

### 3.2.6 WRF-SUEWS

<code>extract_reclassification(path_nml)</code>	Extract reclassification info from path_nml as a DataFrame.
<code>plot_reclassification(path_nml[, path_save, ...])</code>	Produce Sankey Diagram to visualise the reclassification specified in path_nml

#### **supy.util.extract\_reclassification**

`supy.util.extract_reclassification(path_nml: str) → pandas.core.frame.DataFrame`  
Extract reclassification info from path\_nml as a DataFrame.

**Parameters** `path_nml` (*str*) – Path to namelist.suews

**Returns** Reclassification DataFrame with rows for WRF land covers while columns for SUEWS.

**Return type** pd.DataFrame

#### **supy.util.plot\_reclassification**

`supy.util.plot_reclassification(path_nml: str, path_save='LC-WRF-SUEWS.png', width=800, height=360, top=10, bottom=10, left=260, right=60)`  
Produce Sankey Diagram to visualise the reclassification specified in path\_nml

**Parameters**

- **path\_nml** (*str*) – Path to namelist.suews
- **path\_save** (*str*, optional) – Path to save Sankey diagram, by default ‘LC-WRF-SUEWS.png’

- **width** (*int, optional*) – Width of diagram, by default 800
- **height** (*int, optional*) – Height of diagram, by default 360
- **top** (*int, optional*) – Top margin of diagram, by default 10
- **bottom** (*int, optional*) – Bottom margin of diagram, by default 10
- **left** (*int, optional*) – Left margin of diagram, by default 260
- **right** (*int, optional*) – Right margin of diagram, by default 60

**Returns** Sankey Diagram showing the reclassification.

**Return type** Sankey Diagram

### 3.2.7 Plotting

---

<code>plot_comp(df_var[, fig, ax])</code>	Produce a scatter plot with linear regression line to compare simulation results and observations.
<code>plot_day_clm(df_var[, fig, ax])</code>	Produce a ensemble diurnal climatologies with uncertainties shown in inter-quartile ranges.

---

#### supy.util.plot\_comp

`supy.util.plot_comp(df_var, fig=None, ax=None)`

Produce a scatter plot with linear regression line to compare simulation results and observations.

**Parameters** **df\_var** (*pd.DataFrame*) – DataFrame containing variables to plot with datetime as index. Two columns, ‘Obs’ and ‘Sim’ for observations and simulation results, respectively, must exist.

**Returns** figure showing 1:1 line plot

**Return type** MPL.figure

#### supy.util.plot\_day\_clm

`supy.util.plot_day_clm(df_var, fig=None, ax=None)`

Produce a ensemble diurnal climatologies with uncertainties shown in inter-quartile ranges.

**Parameters** **df\_var** (*pd.DataFrame*) – DataFrame containing variables to plot with datetime as index

**Returns** figure showing median lines and IQR in shadings

**Return type** MPL.figure

## 3.3 Command-Line Tools

### 3.3.1 suews-run

Run SUEWS simulation using settings in PATH\_RUNCONTROL (default: “./RunControl.nml”, i.e., the RunControl namelist file in the current directory).

```
suews-run [OPTIONS] [PATH_RUNCONTROL]
```

## Arguments

### **PATH\_RUNCONTROL**

Optional argument

## 3.3.2 suews-convert

Convert SUEWS input tables from older versions to newer ones (one-way only).

```
suews-convert [OPTIONS]
```

## Options

### **-f, --from <fromVer>**

Version to convert from [required]

**Options** 2019a|2018c|2018b|2018a|2017a|2016a

### **-t, --to <toVer>**

Version to convert to [required]

**Options** 2019b|2019a|2018c|2018b|2018a|2017a

### **-i, --input <fromDir>**

Original directory to convert [required]

### **-o, --output <toDir>**

New directory to create for converted tables [required]

## 3.4 Key Data Structures

### 3.4.1 df\_state variables

**Note:** Data structure of `df_state` is explained [here](#).

#### **aerodynamicresistancemethod**

**Description** Internal use. Please DO NOT modify

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** None

#### **ah\_min**

**Description** Minimum QF values.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

**SUEWS-related variables** `AHMin_WD`, `AHMin_WE`

#### **ah\_slope\_cooling**

**Description** Cooling slope of QF calculation.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

**SUEWS-related variables** `AHSlope_Cooling_WD`, `AHSlope_Cooling_WE`

#### **ah\_slope\_heating**

**Description** Heating slope of QF calculation.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

**SUEWS-related variables** `AHSlope_Heating_WD`, `AHSlope_Heating_WE`

#### **ahprof\_24hr**

**Description** Hourly profile values used in energy use calculation.

**Dimensionality** (24, 2)

**Dimensionality Remarks** 24: hours of a day

2: {Weekday, Weekend}

**SUEWS-related variables** `EnergyUseProfWD`, `EnergyUseProfWE`

#### **alb**

**Description** Effective surface albedo (middle of the day value) for summertime.

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water }

**SUEWS-related variables** `AlbedoMax`

#### **albdecctr\_id**

**Description** Albedo of deciduous surface DecTr on day 0 of run

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `albDecTr0`

#### **albevetr\_id**

**Description** Albedo of evergreen surface EveTr on day 0 of run

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `albEveTr0`

#### **albggrass\_id**

**Description** Albedo of grass surface Grass on day 0 of run

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `albGrass0`

**albmax\_dectr**

**Description** Effective surface albedo (middle of the day value) for summertime.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `AlbedoMax`

**albmax\_evetr**

**Description** Effective surface albedo (middle of the day value) for summertime.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `AlbedoMax`

**albmax\_grass**

**Description** Effective surface albedo (middle of the day value) for summertime.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `AlbedoMax`

**albmin\_dectr**

**Description** Effective surface albedo (middle of the day value) for wintertime (not including snow).

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `AlbedoMin`

**albmin\_evetr**

**Description** Effective surface albedo (middle of the day value) for wintertime (not including snow).

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `AlbedoMin`

**albmin\_grass**

**Description** Effective surface albedo (middle of the day value) for wintertime (not including snow).

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `AlbedoMin`

**alpha\_bioco2**

**Description** The mean apparent ecosystem quantum. Represents the initial slope of the light-response curve.

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { `EveTr`, `DecTr`, `Grass` }

**SUEWS-related variables** `alpha`

**alpha\_enh\_bioco2**

**Description** Part of the `alpha` coefficient related to the fraction of vegetation.

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { EveTr, DecTr, Grass }

**SUEWS-related variables** `alpha_enh`

**alt**

**Description** Altitude of grids [m].

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `Alt`

**baset**

**Description** Base Temperature for initiating growing degree days (GDD) for leaf growth. [°C]

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { EveTr, DecTr, Grass }

**SUEWS-related variables** `BaseT`

**baseTe**

**Description** Base temperature for initiating sensescence degree days (SDD) for leaf off. [°C]

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { EveTr, DecTr, Grass }

**SUEWS-related variables** `BaseTe`

**basethdd**

**Description** Base temperature for heating degree days [°C]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `BaseTHDD`

**beta\_bioco2**

**Description** The light-saturated gross photosynthesis of the canopy. [ $\text{umol m}^{-2} \text{ s}^{-1}$  ]

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { EveTr, DecTr, Grass }

**SUEWS-related variables** `beta`

**beta\_enh\_bioco2**

**Description** Part of the `beta` coefficient related to the fraction of vegetation.

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { EveTr, DecTr, Grass }

**SUEWS-related variables** `beta_enh`

**bldgh**

**Description** Mean building height [m]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** [H\\_Bldgs](#)

**capmax\_dec**

**Description** Maximum water storage capacity for upper surfaces (i.e. canopy)

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** [StorageMax](#)

**capmin\_dec**

**Description** Minimum water storage capacity for upper surfaces (i.e. canopy).

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** [StorageMin](#)

**chanohm**

**Description** Bulk transfer coefficient for this surface to use in AnOHM [-]

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { [Paved](#), [Bldgs](#), [EveTr](#), [DecTr](#), [Grass](#), [BSoil](#), [Water](#) }

**SUEWS-related variables** [AnOHM\\_Ch](#)

**co2pointsource**

**Description** CO2 emission factor [ $\text{kg km}^{-1}$ ]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** [CO2PointSource](#)

**cpanohm**

**Description** Volumetric heat capacity for this surface to use in AnOHM [ $\text{J m}^{-3}$ ]

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { [Paved](#), [Bldgs](#), [EveTr](#), [DecTr](#), [Grass](#), [BSoil](#), [Water](#) }

**SUEWS-related variables** [AnOHM\\_Cp](#)

**crwmax**

**Description** Maximum water holding capacity of snow [mm]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** [CRWMax](#)

**crwmin**

**Description** Minimum water holding capacity of snow [mm]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** CRWMin

#### `daywat`

**Description** Irrigation flag: 1 for on and 0 for off.

**Dimensionality** (7,)

**Dimensionality Remarks** 7: {Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday}

**SUEWS-related variables** DayWat (1), DayWat (2), DayWat (3), DayWat (4),  
DayWat (5), DayWat (6), DayWat (7)

#### `daywatper`

**Description** Fraction of properties using irrigation for each day of a week.

**Dimensionality** (7,)

**Dimensionality Remarks** 7: {Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday}

**SUEWS-related variables** DayWatPer (1), DayWatPer (2), DayWatPer (3),  
DayWatPer (4), DayWatPer (5), DayWatPer (6), DayWatPer (7)

#### `decidcap_id`

**Description** Storage capacity of deciduous surface DecTr on day 0 of run.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** decidCap0

#### `dectreeh`

**Description** Mean height of deciduous trees [m]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** H\_DecTr

#### `diagnose`

**Description** Internal use. Please DO NOT modify

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** None

#### `diagqn`

**Description** Internal use. Please DO NOT modify

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** None

#### `diagqs`

**Description** Internal use. Please DO NOT modify

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** None

**drainrt**

**Description** Drainage rate of bucket for LUMPS [mm h<sup>-1</sup>]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** [LUMPS\\_DrRate](#)

**ef\_umolco2perj**

**Description** Emission factor for fuels used for building heating.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** [EF\\_umolCO2perJ](#)

**emis**

**Description** Effective surface emissivity.

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** [Emissivity](#)

**emissionsmethod**

**Description** Determines method for QF calculation.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** [EmissionsMethod](#)

**enddls**

**Description** End of the day light savings [DOY]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**irrfracgrass**

**Description** Fraction of Grass that is irrigated [-]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `IrrFr_Grass`

**kknohm**

**Description** Thermal conductivity for this surface to use in AnOHM [W m K<sup>-1</sup>]

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water }

**SUEWS-related variables** `AnOHM_Kk`

**kmax**

**Description** Maximum incoming shortwave radiation [W m<sup>-2</sup>]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `Kmax`

#### `lai_id`

**Description** Initial LAI values.

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { `EveTr`, `DecTr`, `Grass` }

**SUEWS-related variables** `LAIinitialDecTr`, `LAIinitialEveTr`, `LAIinitialGrass`

#### `laicalcyes`

**Description** Internal use. Please DO NOT modify

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** None

#### `laimax`

**Description** full leaf-on summertime value

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { `EveTr`, `DecTr`, `Grass` }

**SUEWS-related variables** `LAIMax`

#### `laimin`

**Description** leaf-off wintertime value

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { `EveTr`, `DecTr`, `Grass` }

**SUEWS-related variables** `LAIMin`

#### `laipower`

**Description** parameters required by LAI calculation.

**Dimensionality** (4, 3)

**Dimensionality Remarks** 4: { `LeafGrowthPower1`, `LeafGrowthPower2`,  
`LeafOffPower1`, `LeafOffPower2` }

3: { `EveTr`, `DecTr`, `Grass` }

**SUEWS-related variables** `LeafGrowthPower1`, `LeafGrowthPower2`, `LeafOffPower1`,  
`LeafOffPower2`

#### `laitype`

**Description** LAI calculation choice.

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { `EveTr`, `DecTr`, `Grass` }

**SUEWS-related variables** `LAIEq`

#### `lat`

**Description** Latitude [deg].

**Dimensionality** 0  
**Dimensionality Remarks** Scalar  
**SUEWS-related variables** `lat`

**lng**

**Description** longitude [deg]  
**Dimensionality** 0  
**Dimensionality Remarks** Scalar  
**SUEWS-related variables** `lng`

**maxconductance**

**Description** The maximum conductance of each vegetation or surface type. [ $\text{mm s}^{-1}$ ]  
**Dimensionality** (3,)  
**Dimensionality Remarks** 3: { EveTr, DecTr, Grass}  
**SUEWS-related variables** `MaxConductance`

**maxfcmetab**

**Description** Maximum (day) CO<sub>2</sub> from human metabolism. [ $\text{W m}^{-2}$ ]  
**Dimensionality** 0  
**Dimensionality Remarks** Scalar  
**SUEWS-related variables** `MaxFCMetab`

**maxqfmetab**

**Description** Maximum value for human heat emission. [ $\text{W m}^{-2}$ ]  
**Dimensionality** 0  
**Dimensionality Remarks** Scalar  
**SUEWS-related variables** `MaxQFMetab`

**min\_res\_bioco2**

**Description** Minimum soil respiration rate (for cold-temperature limit) [ $\text{umol m}^{-2} \text{s}^{-1}$ ].  
**Dimensionality** (3,)  
**Dimensionality Remarks** 3: { EveTr, DecTr, Grass}  
**SUEWS-related variables** `min_respi`

**minfcmetab**

**Description** Minimum (night) CO<sub>2</sub> from human metabolism. [ $\text{W m}^{-2}$ ]  
**Dimensionality** 0  
**Dimensionality Remarks** Scalar  
**SUEWS-related variables** `MinFCMetab`

**minqfmetab**

**Description** Minimum value for human heat emission. [ $\text{W m}^{-2}$ ]  
**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `MinQFMetab`

#### `narp_emis_snow`

**Description** Effective surface emissivity.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `Emissivity`

#### `narp_trans_site`

**Description** Atmospheric transmissivity for NARP [-]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `NARP_Trans`

#### `netradiationmethod`

**Description** Determines method for calculation of radiation fluxes.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `NetRadiationMethod`

#### `ohm_coef`

**Description** Coefficients for OHM calculation.

**Dimensionality** (8, 4, 3)

**Dimensionality Remarks** 8: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water`, one extra land cover type (currently NOT used)}

4: {`SummerWet`, `SummerDry`, `WinterWet`, `WinterDry`}

3: {`a1`, `a2`, `a3`}

**SUEWS-related variables** `a1`, `a2`, `a3`

#### `ohm_threshsw`

**Description** Temperature threshold determining whether summer/winter OHM coefficients are applied [°C]

**Dimensionality** (8,)

**Dimensionality Remarks** 8: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water`, one extra land cover type (currently NOT used)}

**SUEWS-related variables** `OHMThresh_SW`

#### `ohm_threshwd`

**Description** Soil moisture threshold determining whether wet/dry OHM coefficients are applied [-]

**Dimensionality** (8,)

**Dimensionality Remarks** 8: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water`, one extra land cover type (currently NOT used)}

**SUEWS-related variables** `OHMThresh_WD`**ohmincqf****Description** Determines whether the storage heat flux calculation uses  $Q^*$  or ( $Q^* + QF$ ).**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** `OHMIncQF`**pipecapacity****Description** Storage capacity of pipes [mm]**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** `PipeCapacity`**popdensdaytime****Description** Daytime population density (i.e. workers, tourists) [people ha<sup>-1</sup>]**Dimensionality** (2,)**Dimensionality Remarks** 2: {Weekday, Weekend}**SUEWS-related variables** `PopDensDay`**popdensnighttime****Description** Night-time population density (i.e. residents) [people ha<sup>-1</sup>]**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** `PopDensNight`**popprof\_24hr****Description** Hourly profile values used in dynamic population estimation.**Dimensionality** (24, 2)**Dimensionality Remarks** 24: hours of a day

2: {Weekday, Weekend}

**SUEWS-related variables** `PopProfWD`, `PopProfWE`**pormax\_dec****Description** full leaf-on summertime value Used only for DecTr (can affect roughness calculation)**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** `PorosityMax`**pormin\_dec****Description** leaf-off wintertime value Used only for DecTr (can affect roughness calculation)**Dimensionality** 0**Dimensionality Remarks** Scalar

SUEWS-related variables `PorosityMin`

**porosity\_id**

**Description** Porosity of deciduous vegetation on day 0 of run.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

SUEWS-related variables `porosity0`

**preciplimit**

**Description** Temperature limit when precipitation falls as snow [°C]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

SUEWS-related variables `PrecipLimSnow`

**preciplimitalb**

**Description** Limit for hourly precipitation when the ground is fully covered with snow [mm]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

SUEWS-related variables `PrecipLimAlb`

**qf0\_beu**

**Description** Building energy use [ $\text{W m}^{-2}$ ]

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

SUEWS-related variables `QF0_BEU_WD, QF0_BEU_WE`

**qf\_a**

**Description** Base value for QF calculation.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

SUEWS-related variables `QF_A_WD, QF_A_WE`

**qf\_b**

**Description** Parameter related to heating degree days.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

SUEWS-related variables `QF_B_WD, QF_B_WE`

**qf\_c**

**Description** Parameter related to heating degree days.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

SUEWS-related variables `QF_C_WD, QF_C_WE`

**radmeltfact**

**Description** Hourly radiation melt factor of snow [mm W<sup>-1</sup> h<sup>-1</sup>]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** RadMeltFactor

**raincover**

**Description** Limit when surface totally covered with water for LUMPS [mm]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** LUMPS\_Cover

**rainmaxres**

**Description** Maximum water bucket reservoir [mm] Used for LUMPS surface wetness control.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** LUMPS\_MaxRes

**resp\_a**

**Description** Respiration coefficient a.

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { EveTr, DecTr, Grass}

**SUEWS-related variables** resp\_a

**resp\_b**

**Description** Respiration coefficient b - related to air temperature dependency.

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { EveTr, DecTr, Grass}

**SUEWS-related variables** resp\_b

**roughlenheatmethod**

**Description** Determines method for calculating roughness length for heat.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** RoughLenHeatMethod

**roughlenmommethod**

**Description** Determines how aerodynamic roughness length (z0m) and zero displacement height (zdm) are calculated.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** RoughLenMomMethod

**runofftowater**

**Description** Fraction of above-ground runoff flowing to water surface during flooding [-]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** RunoffToWater

**s1**

**Description** A parameter related to soil moisture dependence [-]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** S1

**s2**

**Description** A parameter related to soil moisture dependence [mm]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** S2

**sathydraulicconduct**

**Description** Hydraulic conductivity for saturated soil [mm s<sup>-1</sup>]

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** SatHydraulicCond

**sddfull**

**Description** The sensesence degree days (SDD) needed to initiate leaf off. [°C]

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { EveTr, DecTr, Grass}

**SUEWS-related variables** SDDFull

**sfr**

**Description** Surface cover fractions.

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** Fr\_Bldgs, Fr\_Bsoil, Fr\_DecTr, Fr\_EveTr, Fr\_Grass, Fr\_Paved, Fr\_Water

**smdmethod**

**Description** Determines method for calculating soil moisture deficit (SMD).

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** SMDMethod

**snowalb****Description** Initial snow albedo**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** [SnowAlb0](#)**snowalbmax****Description** Effective surface albedo (middle of the day value) for summertime.**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** [AlbedoMax](#)**snowalbmin****Description** Effective surface albedo (middle of the day value) for wintertime (not including snow).**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** [AlbedoMin](#)**snowdens****Description** Initial snow density of each land cover.**Dimensionality** (7,)**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}**SUEWS-related variables** [SnowDensBldgs](#), [SnowDensPaved](#), [SnowDensDecTr](#),  
[SnowDensEveTr](#), [SnowDensGrass](#), [SnowDensBSoil](#), [SnowDensWater](#)**snowdensmax****Description** Maximum snow density [kg m<sup>-3</sup>]**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** [SnowDensMax](#)**snowdensmin****Description** Fresh snow density [kg m<sup>-3</sup>]**Dimensionality** 0**Dimensionality Remarks** Scalar**SUEWS-related variables** [SnowDensMin](#)**snowfrac****Description** Initial plan area fraction of snow on each land cover<sup>4</sup>**Dimensionality** (7,)**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}**SUEWS-related variables** [SnowFracBldgs](#), [SnowFracPaved](#), [SnowFracDecTr](#),  
[SnowFracEveTr](#), [SnowFracGrass](#), [SnowFracBSoil](#), [SnowFracWater](#)

**snowlimbldg**

**Description** Limit of the snow water equivalent for snow removal from roads and roofs [mm]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `SnowLimRemove`

**snowlimpaved**

**Description** Limit of the snow water equivalent for snow removal from roads and roofs [mm]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `SnowLimRemove`

**snowpack**

**Description** Initial snow water equivalent on each land cover

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** `SnowPackBldgs`, `SnowPackPaved`, `SnowPackDecTr`,  
`SnowPackEveTr`, `SnowPackGrass`, `SnowPackBSoil`, `SnowPackWater`

**snowpacklimit**

**Description** Limit for the snow water equivalent when snow cover starts to be patchy [mm]

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** `SnowLimPatch`

**snowprof\_24hr**

**Description** Hourly profile values used in snow clearing.

**Dimensionality** (24, 2)

**Dimensionality Remarks** 24: hours of a day

2: {Weekday, Weekend}

**SUEWS-related variables** `SnowClearingProfWD`, `SnowClearingProfWE`

**snowuse**

**Description** Determines whether the snow part of the model runs.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `SnowUse`

**snowwater**

**Description** Initial amount of liquid water in the snow on each land cover

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** `SnowWaterBldgsState`, `SnowWaterPavedState`,  
`SnowWaterDecTrState`, `SnowWaterEveTrState`, `SnowWaterGrassState`,  
`SnowWaterBSoilState`, `SnowWaterWaterState`

**soildepth**

**Description** Depth of soil beneath the surface [mm]

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** `SoilDepth`

**soilstore\_id**

**Description** Initial water stored in soil beneath each land cover

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** `SoilstoreBldgsState`, `SoilstorePavedState`,  
`SoilstoreDecTrState`, `SoilstoreEveTrState`, `SoilstoreGrassState`,  
`SoilstoreBSoilState`

**soilstorecap**

**Description** Limit value for `SoilDepth` [mm]

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** `SoilStoreCap`

**stabilitymethod**

**Description** Defines which atmospheric stability functions are used.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `StabilityMethod`

**startdls**

**Description** Start of the day light savings [DOY]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `StartDLS`

**state\_id**

**Description** Initial wetness condition on each land cover

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** `BldgsState`, `PavedState`, `DecTrState`, `EveTrState`,  
`GrassState`, `BSoilState`, `WaterState`

**statelimit**

**Description** Upper limit to the surface state. [mm]

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** StateLimit

#### **storageheatmethod**

**Description** Determines method for calculating storage heat flux  $\Delta Q_S$ .

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** StorageHeatMethod

#### **storedrainprm**

**Description** Coefficients used in drainage calculation.

**Dimensionality** (6, 7)

**Dimensionality Remarks** 6: { StorageMin, DrainageEq, DrainageCoef1, DrainageCoef2, StorageMax, current storage}

7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** DrainageCoef1, DrainageCoef2, DrainageEq, StorageMax, StorageMin

#### **surfacearea**

**Description** Area of the grid [ha].

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** SurfaceArea

#### **t\_critic\_cooling**

**Description** Critical cooling temperature.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

**SUEWS-related variables** TCritic\_Cooling\_WD, TCritic\_Cooling\_WE

#### **t\_critic\_heating**

**Description** Critical heating temperature.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

**SUEWS-related variables** TCritic\_Heating\_WD, TCritic\_Heating\_WE

#### **tau\_a**

**Description** Time constant for snow albedo aging in cold snow [-]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** tau\_a

#### **tau\_f**

**Description** Time constant for snow albedo aging in melting snow [-]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `tau_f`

#### `tau_r`

**Description** Time constant for snow density ageing [-]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `tau_r`

#### `tempmeltfact`

**Description** Hourly temperature melt factor of snow [mm K<sup>-1</sup> h<sup>-1</sup>]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `TempMeltFactor`

#### `th`

**Description** Upper air temperature limit [°C]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `TH`

#### `theta_bioco2`

**Description** The convexity of the curve at light saturation.

**Dimensionality** (3,)

**Dimensionality Remarks** 3: { `EveTr`, `DecTr`, `Grass` }

**SUEWS-related variables** `theta`

#### `timezone`

**Description** Time zone [h] for site relative to UTC (east is positive). This should be set according to the times given in the meteorological forcing file(s).

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `Timezone`

#### `t1`

**Description** Lower air temperature limit [°C]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `TL`

#### `trafficrate`

**Description** Traffic rate used for CO2 flux calculation.

**Dimensionality** (2,)

**Dimensionality Remarks** 2: {Weekday, Weekend}

**SUEWS-related variables** `TrafficRate_WD`, `TrafficRate_WE`

#### **trafficunits**

**Description** Units for the traffic rate for the study area. Not used in v2018a.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `TrafficUnits`

#### **traffprof\_24hr**

**Description** Hourly profile values used in traffic activity calculation.

**Dimensionality** (24, 2)

**Dimensionality Remarks** 24: hours of a day

2: {Weekday, Weekend}

**SUEWS-related variables** `TraffProfWD`, `TraffProfWE`

#### **tstep**

**Description** Specifies the model time step [s].

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `Tstep`

#### **veg\_type**

**Description** Internal use. Please DO NOT modify

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** None

#### **waterdist**

**Description** Fraction of water redistribution

**Dimensionality** (8, 6)

**Dimensionality Remarks** 8: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water`, one extra land cover type (currently NOT used)}

6: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`}

**SUEWS-related variables** `ToBSoil`, `ToBldgs`, `ToDecTr`, `ToEveTr`, `ToGrass`, `ToPaved`, `ToRunoff`, `ToSoilStore`, `ToWater`

#### **waterusemethod**

**Description** Defines how external water use is calculated.

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `WaterUseMethod`

**wetthresh**

**Description** Depth of water which determines whether evaporation occurs from a partially wet or completely wet surface [mm].

**Dimensionality** (7,)

**Dimensionality Remarks** 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

**SUEWS-related variables** `WetThreshold`

**wuprofa\_24hr**

**Description** Hourly profile values used in automatic irrigation.

**Dimensionality** (24, 2)

**Dimensionality Remarks** 24: hours of a day

2: {Weekday, Weekend}

**SUEWS-related variables** `WaterUseProfAutoWD`, `WaterUseProfAutoWE`

**wuprofm\_24hr**

**Description** Hourly profile values used in manual irrigation.

**Dimensionality** (24, 2)

**Dimensionality Remarks** 24: hours of a day

2: {Weekday, Weekend}

**SUEWS-related variables** `WaterUseProfManuWD`, `WaterUseProfManuWE`

**z**

**Description** Measurement height [m].

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `z`

**z0m\_in**

**Description** Roughness length for momentum [m]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `z0`

**zdm\_in**

**Description** Zero-plane displacement [m]

**Dimensionality** 0

**Dimensionality Remarks** Scalar

**SUEWS-related variables** `zd`

### 3.4.2 df\_forcing variables

---

**Note:** Data structure of df\_forcing is explained [here](#).

---

**RH**

**Description** Relative Humidity [%]

**Tair**

**Description** Air temperature [°C]

**U**

**Description** Wind speed [m s<sup>-1</sup>] Height of the wind speed measurement (z) is needed in SUEWS\_SiteSelect.txt.

**Wuh**

**Description** External water use [m<sup>3</sup>]

**fcld**

**Description** Cloud fraction [tenths]

**id**

**Description** Day of year [DOY]

**imin**

**Description** Minute [M]

**isec**

**Description** Second [S]

**it**

**Description** Hour [H]

**iy**

**Description** Year [YYYY]

**kdiff**

**Description** Diffuse radiation [W m<sup>-2</sup>] **Recommended in this version.** if SOLWEIGUse = 1

**kdir**

**Description** Direct radiation [W m<sup>-2</sup>] **Recommended in this version.** if SOLWEIGUse = 1

**kdown**

**Description** Incoming shortwave radiation [W m<sup>-2</sup>] Must be > 0 W m<sup>-2</sup>.

**lai**

**Description** Observed leaf area index [m<sup>2</sup> m<sup>-2</sup>]

**ldown**

**Description** Incoming longwave radiation [W m<sup>-2</sup>]

**pres**

**Description** Barometric pressure [kPa]

**qe**

**Description** Latent heat flux [ $\text{W m}^{-2}$ ]

**qf**

**Description** Anthropogenic heat flux [ $\text{W m}^{-2}$ ]

**qh**

**Description** Sensible heat flux [ $\text{W m}^{-2}$ ]

**qn**

**Description** Net all-wave radiation [ $\text{W m}^{-2}$ ] Required if `NetRadiationMethod` = 0.

**qs**

**Description** Storage heat flux [ $\text{W m}^{-2}$ ]

**rain**

**Description** Rainfall [mm]

**snow**

**Description** Snow cover fraction (0 – 1) [-] Required if `SnowUse` = 1

**wdir**

**Description** Wind direction [ $^{\circ}$ ] **Not available in this version.**

**xsmo**

**Description** Observed soil moisture [ $\text{m}^3 \text{ m}^{-3}$ ] or [ $\text{kg kg}^{-1}$ ]

### 3.4.3 df\_output variables

---

**Note:** Data structure of `df_output` is explained [here](#).

---

**AddWater**

**Description** Additional water flow received from other grids [mm]

**Group** SUEWS

**AlbBulk**

**Description** Bulk albedo [-]

**Group** SUEWS

**AlbDecTr**

**Description** Albedo of deciduous trees [-]

**Group** DailyState

**AlbEveTr**

**Description** Albedo of evergreen trees [-]

**Group** DailyState

**AlbGrass**

**Description** Albedo of grass [-]

**Group** DailyState

**AlbSnow**

**Description** Snow albedo [-]

**Group** SUEWS

**AlbSnow**

**Description** Snow albedo [-]

**Group** DailyState

**Azimuth**

**Description** Solar azimuth angle [°]

**Group** SUEWS

**DLHrs**

**Description** Day length [h]

**Group** DailyState

**DaysSR**

**Description** Days since rain [days]

**Group** DailyState

**DecidCap**

**Description** Moisture storage capacity of deciduous trees [mm]

**Group** DailyState

**DensSnow\_BSoil**

**Description** Snow density – bare soil surface [ $\text{kg m}^{-3}$ ]

**Group** snow

**DensSnow\_BS0il**

**Description** Snow density - bare soil surface [ $\text{kg m}^{-3}$ ]

**Group** snow

**DensSnow\_BS0il**

**Description** Snow density - bare soil surface [ $\text{kg m}^{-3}$ ]

**Group** DailyState

**DensSnow\_BS0il**

**Description** Snow density – bare soil surface [ $\text{kg m}^{-3}$ ]

**Group** DailyState

**DensSnow\_Bldgs**

**Description** Snow density – building surface [ $\text{kg m}^{-3}$ ]

**Group** DailyState

**DensSnow\_Bldgs**

**Description** Snow density - building surface [ $\text{kg m}^{-3}$ ]

**Group** DailyState

**DensSnow\_Bldgs**

**Description** Snow density - building surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_Bldgs**

**Description** Snow density – building surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_DecTr**

**Description** Snow density - deciduous surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_DecTr**

**Description** Snow density – deciduous surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_DecTr**

**Description** Snow density - deciduous surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_DecTr**

**Description** Snow density – deciduous surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_EveTr**

**Description** Snow density - evergreen surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_EveTr**

**Description** Snow density – evergreen surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_EveTr**

**Description** Snow density - evergreen surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_EveTr**

**Description** Snow density – evergreen surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_Grass**

**Description** Snow density – grass surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_Grass**

**Description** Snow density - grass surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_Grass**

**Description** Snow density - grass surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_Grass**

**Description** Snow density – grass surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_Paved**

**Description** Snow density – paved surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_Paved**

**Description** Snow density - paved surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_Paved**

**Description** Snow density – paved surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_Paved**

**Description** Snow density - paved surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_Water**

**Description** Snow density - water surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_Water**

**Description** Snow density – water surface [kg m<sup>-3</sup>]

**Group** snow

**DensSnow\_Water**

**Description** Snow density - water surface [kg m<sup>-3</sup>]

**Group** DailyState

**DensSnow\_Water**

**Description** Snow density – water surface [kg m<sup>-3</sup>]

**Group** DailyState

**Drainage**

**Description** Drainage [mm]

**Group** SUEWS

**Evap**

**Description** Evaporation [mm]

**Group** SUEWS

**Fc**

**Description** CO<sub>2</sub> flux [umol m<sup>-2</sup> s<sup>-1</sup>]

**Group** SUEWS

**FcBuild**

**Description** CO<sub>2</sub> flux from buildings [umol m<sup>-2</sup> s<sup>-1</sup>]

**Group** SUEWS

**FcMetab**

**Description** CO<sub>2</sub> flux from metabolism [umol m<sup>-2</sup> s<sup>-1</sup>]

**Group** SUEWS

**FcPhoto**

**Description** CO<sub>2</sub> flux from photosynthesis [umol m<sup>-2</sup> s<sup>-1</sup>]

**Group** SUEWS

**FcPoint**

**Description** CO<sub>2</sub> flux from point source [umol m<sup>-2</sup> s<sup>-1</sup>]

**Group** SUEWS

**FcRespi**

**Description** CO<sub>2</sub> flux from respiration [umol m<sup>-2</sup> s<sup>-1</sup>]

**Group** SUEWS

**FcTraff**

**Description** CO<sub>2</sub> flux from traffic [umol m<sup>-2</sup> s<sup>-1</sup>]

**Group** SUEWS

**Fcld**

**Description** Cloud fraction [-]

**Group** SUEWS

**FlowCh**

**Description** Additional flow into water body [mm]

**Group** SUEWS

**GDD\_DecTr**

**Description** Growing degree days for deciduous tree [°C d]

**Group** DailyState

**GDD\_EveTr**

**Description** Growing degree days for evergreen tree [°C d]

**Group** DailyState

**GDD\_Grass**

**Description** Growing degree days for grass [°C d]

**Group** DailyState

**HDD1\_h**

**Description** Heating degree days [ $^{\circ}\text{C d}$ ]

**Group** DailyState

**HDD2\_c**

**Description** Cooling degree days [ $^{\circ}\text{C d}$ ]

**Group** DailyState

**HDD3\_Tmean**

**Description** Average daily air temperature [ $^{\circ}\text{C}$ ]

**Group** DailyState

**HDD4\_T5d**

**Description** 5-day running-mean air temperature [ $^{\circ}\text{C}$ ]

**Group** DailyState

**Irr**

**Description** Irrigation [mm]

**Group** SUEWS

**Kdown**

**Description** Incoming shortwave radiation [ $\text{W m}^{-2}$ ]

**Group** SUEWS

**Kup**

**Description** Outgoing shortwave radiation [ $\text{W m}^{-2}$ ]

**Group** SUEWS

**LAI**

**Description** Leaf area index [ $\text{m}^2 \text{m}^{-2}$ ]

**Group** SUEWS

**LAI\_DecTr**

**Description** Leaf area index of deciduous trees [ $\text{m}^2 \text{m}^{-2}$ ]

**Group** DailyState

**LAI\_EveTr**

**Description** Leaf area index of evergreen trees [ $\text{m}^2 \text{m}^{-2}$ ]

**Group** DailyState

**LAI\_Grass**

**Description** Leaf area index of grass [ $\text{m}^2 \text{m}^{-2}$ ]

**Group** DailyState

**LAIlumps**

**Description** Leaf area index used in LUMPS (normalised 0-1) [-]

**Group** DailyState

**Ldown**

**Description** Incoming longwave radiation [ $\text{W m}^{-2}$ ]

**Group** SUEWS

**Lob**

**Description** Obukhov length [m]

**Group** SUEWS

**Lup**

**Description** Outgoing longwave radiation [ $\text{W m}^{-2}$ ]

**Group** SUEWS

**MeltWStore**

**Description** Meltwater store [mm]

**Group** SUEWS

**MeltWater**

**Description** Meltwater [mm]

**Group** SUEWS

**MwStore\_BSoil**

**Description** Melt water store – bare soil surface [mm]

**Group** snow

**MwStore\_Bldgs**

**Description** Melt water store – building surface [mm]

## FAQ

---

### Contents

- *I cannot install SuPy following the docs, what is wrong there?*
- *How do I know which version of SuPy I am using?*
- *A kernel may have died exception happened, where did I go wrong?*
- *How can I upgrade SuPy to an up-to-date version?*

## 4.1 I cannot install SuPy following the docs, what is wrong there?

please check if your environment meets the following requirements:

1. Operating system (OS):
  - a. is it 64 bit? only 64 bit systems are supported.
  - b. is your OS up to date? only recent desktop systems are supported:
    - Windows 10 and above
    - macOS 10.13 and above
    - Linux: no restriction; If SuPy cannot run on your specific Linux distribution, please report it to us.

You can get the OS information with the following code:

```
import platform  
platform.platform()
```

2. Python interpreter:

- a. is your Python interpreter 64 bit?

Check running mode with the following code:

```
import struct  
struct.calcsize('P') * 8
```

- b. is your Python version above 3.5?

Check version info with the following code:

```
import sys  
sys.version
```

If your environment doesn't meet the requirement by SuPy, please use a proper environment; otherwise, [please report your issue](#).

## 4.2 How do I know which version of SuPy I am using?

Use the following code:

```
import supy  
supy.show_version()
```

---

**Note:** `show_version` is only available after v2019.5.28.

---

## 4.3 A kernel may have died exception happened, where did I go wrong?

The issue is highly likely due to invalid input to SuPy and SUEWS kernel. We are trying to avoid such exceptions, but unfortunately they might happen in some edge cases.

Please [report such issues to us](#) with your input files for debugging. Thanks!

## 4.4 How can I upgrade SuPy to an up-to-date version?

Run the following code in your terminal:

```
python3 -m pip install supy --upgrade
```

# CHAPTER 5

---

## Version History

---

### 5.1 Version 20190829

- **New**

1. added WRF-SUEWS related functions.
2. added [diagnostics of canyon profiles](#).

- **Improvement**

None.

- **Changes**

1. synchronised with v2019a interface: minimum supy\_driver v2019a2.

- **Fix**

None.

- **Known issue**

1. ESTM is not supported yet.
2. BLUEWS, a CBL modules in SUEWS, is not supported yet.
3. Performance in parallel mode can be worse than serial mode sometimes due to heavy (de)-serialisation loads.

### 5.2 Version 2019.7.17

- **New**

1. added OHM related functions.
2. added surface conductance related functions.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

1. Fixed a bug in unit conversion for TMY data generation.

- **Known issue**

ESTM is not supported yet.

## 5.3 Version 2019.6.8

- **New**

None.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

1. Fixed a bug in rescaling Kdown when loading forcing data.

- **Known issue**

ESTM is not supported yet.

## 5.4 Version 2019.5.28

Spring house cleaning with long-await command line tools (more on the way!).

- **New**

1. Added version info function: `show_version`.
2. Added command line tools:
  - `suews-run`: SuPy wrapper to mimic SUEWS-binary-based simulation.
  - `suews-convert`: convert input tables from older versions to newer ones (one-way only).

- **Improvement**

None.

- **Changes**

None.

- **Fix**

1. Fixed a bug in writing out multi-grid output files caused by incorrect dropping of temporal information by pandas .

- **Known issue**

ESTM is not supported yet.

## 5.5 Version 2019.4.29

Parallel run.

- **New**

Added support for parallel run on the fly.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

## 5.6 Version 2019.4.17

UMEP compatibility tweaks.

- **New**

None.

- **Improvement**

None.

- **Changes**

`Error messages`: `problems.txt` will be written out in addition to the console error message similarly as SUEWS binary.

- **Fix**

Incorrect caching of input libraries.

- **Known issue**

None

## 5.7 Version 2019.4.15

ERA-5 download.

- **New**

Added experimental support for downloading and processing ERA-5 data to force supy simulations.

- **Improvement**

Improved compatibility with earlier `pandas` version in resampling output.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

## 5.8 Version 2019.3.21

TMY generation.

- **New**

Added preliminary support for generating TMY dataset with SuPy output.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

## 5.9 Version 2019.3.14

This release improved memory usage.

- **New**

None.

- **Improvement**

Optimised memory consumption for longterm simulations.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

## 5.10 Version 2019.2.25

This release dropped support for Python 3.5 and below.

- **New**

None.

- **Improvement**

None.

- **Changes**

Dropped support for Python 3.5 and below.

- **Fix**

None.

- **Known issue**

None

## 5.11 Version 2019.2.24

This release added the ability to save output files.

- **New**

1. Added support to save output files. See: `supy.save_supy()`
2. Added support to initialise SuPy from saved `df_state.csv`. See: `supy.init_supy()`

- **Improvement**

None.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

## 5.12 Version 2019.2.19

This is a release that improved the exception handling due to fatal error in `supy_driver`.

- **New**

Added support to handle python kernel crash caused by fatal error in `supy_driver` kernel; so python kernel won't crash any more even `supy_driver` is stopped.

- **Improvement**

None.

- **Changes**

None

- **Fix**

None.

- **Known issue**

None

## 5.13 Version 2019.2.8

This is a release that fixes recent bugs found in SUEWS that may lead to abnormal simulation results of storage heat flux, in particular when `SnowUse` is enabled (i.e., `snowuse=1`).

- **New**

None.

- **Improvement**

Improved the performance in loading initial model state from a large number of grids (>1k)

- **Changes**

Updated SampleRun dataset by: 1. setting surface fractions (`sfr`) to a more realistic value based on London KCL case; 2. enabling snow module (`snowuse=1`).

- **Fix**

1. Fixed a bug in the calculation of storage heat flux.
2. Fixed a bug in loading `popdens` for calculating anthropogenic heat flux.

- **Known issue**

None

## 5.14 Version 2019.1.1 (preview release, 01 Jan 2019)

- **New**

1. Slimmed the output groups by excluding unsupported `ESTM` results
2. SuPy documentation
  - Key IO data structures documented:
    - `df_output variables` (GH9)
    - `df_state variables` (GH8)
    - `df_forcing variables` (GH7)
  - Tutorial of parallel SuPy simulations for impact studies

- **Improvement**

1. Improved calculation of OHM-related radiation terms

- **Changes**

None.

- **Fix**

None

- **Known issue**

None

## 5.15 Version 2018.12.15 (internal test release in December 2018)

- **New**

1. Preview release of SuPy based on the computation kernel of SUEWS 2018b

- **Improvement**

1. Improved calculation of OHM-related radiation terms

- **Changes**

None.

- **Fix**

None

- **Known issue**

1. The heat storage modules AnOHM and ESTM are not supported yet.
