- **What is SuPy?**

SuPy is a Python-enhanced urban climate model with SUEWS as its computation core.

The scientific rigour in SuPy results is thus guaranteed by SUEWS (see SUEWS publications and Parameterisations and sub-models within SUEWS).

Meanwhile, the data analysis ability of SuPy is greatly enhanced by the Python-based SciPy Stack, notably numpy and pandas. More details are described in our SuPy paper.

- **How to get SuPy?**

SuPy is available on all major platforms (macOS, Windows, Linux) for Python 3.6+ (64-bit only) via PyPI:

```
python3 -m pip install supy --upgrade
```

- **How to use SuPy?**

- Please follow [Quickstart of SuPy](#) and [other tutorials](#).
- Please see [API reference](#) for details.
- Please see [FAQ](#) if any issue.

- **How to contribute to SuPy?**

- Add your development via [Pull Request](#)
- Report issues via the [GitHub page](#).
- Cite our [SuPy paper](#).
- Provide suggestions and feedback.

CHAPTER 1

Tutorials

To familiarise users with SuPy urban climate modelling and to demonstrate the functionality of SuPy, we provide the following tutorials in [Jupyter notebooks](#):

The following section was generated from `docs/source/tutorial/quick-start.ipynb`

1.1 Quickstart of SuPy

This quickstart demonstrates the essential and simplest workflow of `supy` in SUEWS simulation:

1. *load input files*
2. *run simulation*
3. *examine results*

More advanced use of `supy` are available in the [*tutorials*](#)

Before start, we need to load the following necessary packages.

```
[1]: import matplotlib.pyplot as plt
import supy as sp
import pandas as pd
import numpy as np
from pathlib import Path
get_ipython().run_line_magic('matplotlib', 'inline')

# produce high-quality figures, which can also be set as one of ['svg', 'pdf', 'retina',
# ↪, 'png']
# 'svg' produces high quality vector figures
%config InlineBackend.figure_format = 'svg'
```

```
[2]: sp.show_version()
```

```
supy: 2019.8.30dev
supy_driver: 2019a4
```

1.1.1 Load input files

For existing SUEWS users:

First, a path to SUEWS RunControl.nml should be specified, which will direct supy to locate input files.

```
[3]: path_runcontrol = Path('../sample_run') / 'RunControl.nml'
```

```
[4]: df_state_init = sp.init_supy(path_runcontrol)
```

```
INFO:root:All cache cleared.
```

A sample df_state_init looks below (note that .T is used here to a nicer tableform view):

```
[5]: df_state_init.filter(like='method').T
```

```
[5]:
```

	grid	98
var	ind_dim	
aerodynamicresistancemethod	0	2
evapmethod	0	2
emissionsmethod	0	2
netradiationmethod	0	3
roughlenheatmethod	0	2
roughlenmommethod	0	2
smdmethod	0	0
stabilitymethod	0	3
storageheatmethod	0	1
waterusemethod	0	0

Following the convention of SUEWS, supy loads meteorological forcing (met-forcing) files at the grid level.

```
[6]: grid = df_state_init.index[0]
df_forcing = sp.load_forcing_grid(path_runcontrol, grid)
```

```
INFO:root:All cache cleared.
```

For new users to SUEWS/SuPy:

To ease the input file preparation, a helper function `load_SampleData` is provided to get the sample input for SuPy simulations

```
[7]: df_state_init, df_forcing = sp.load_SampleData()
```

```
INFO:root:All cache cleared.
```

Overview of SuPy input

df_state_init

`df_state_init` includes model Initial state consisting of:

- surface characteristics (e.g., albedo, emissivity, land cover fractions, etc.; full details refer to SUEWS documentation)
- model configurations (e.g., stability; full details refer to SUEWS documentation)

Detailed description of variables in `df_state_init` refers to *SuPy input*

Surface land cover fraction information in the sample input dataset:

```
[8]: df_state_init.loc[:,['bldgh','evetreeh','dectreeh']]
```

```
[8]: var      bldgh dectreeh evetreeh
ind_dim      0          0          0
grid
98        22.0       13.1       13.1
```

```
[9]: df_state_init.filter(like='sfr')
```

```
[9]: var      sfr
ind_dim (0,) (1,) (2,) (3,) (4,) (5,) (6,)
grid
98      0.43  0.38  0.001  0.019  0.029  0.001  0.14
```

df_forcing

`df_forcing` includes meteorological and other external forcing information.

Detailed description of variables in `df_forcing` refers to *SuPy input*.

Below is an overview of forcing variables of the sample data set used in the following simulations.

```
[10]: list_var_forcing = [
    'kdown',
    'Tair',
    'RH',
    'pres',
    'U',
    'rain',
]
dict_var_label = {
    'kdown': 'Incoming Solar\n Radiation ($ \mathrm{W} \mathrm{m}^{-2} )$',
    'Tair': 'Air Temperature ($^{\circ}\mathrm{C}$)',
    'RH': r'Relative Humidity (%)',
    'pres': 'Air Pressure (hPa)',
    'rain': 'Rainfall (mm)',
    'U': 'Wind Speed (m $\mathrm{s}^{-1}$)'
}
df_plot_forcing_x = df_forcing.loc[:, list_var_forcing].copy().shift(
    -1).dropna(how='any')
df_plot_forcing = df_plot_forcing_x.resample('1h').mean()
df_plot_forcing['rain'] = df_plot_forcing_x['rain'].resample('1h').sum()

axes = df_plot_forcing.plot(
    subplots=True,
    figsize=(8, 12),
    legend=False,
)
fig = axes[0].figure
```

(continues on next page)

(continued from previous page)

```
fig.tight_layout()
fig.autofmt_xdate(bottom=0.2, rotation=0, ha='center')
for ax, var in zip(axes, list_var_forcing):
    ax.set_ylabel(dict_var_label[var])
```

Modification of SuPy input

Given `pandas.DataFrame` as the core data structure of SuPy, all operations, including modification, output, demonstration, etc., on SuPy inputs (`df_state_init` and `df_forcing`) can be done using `pandas`-based functions/methods.

Specifically, for modification, the following operations are essential:

locating data

Data can be located in two ways, namely: 1. by name via ``.loc`` <http://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#selection-by-label>`__; 2. by position via ``.iloc`` <http://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#selection-by-position>`__.

```
[11]: # view the surface fraction variable: `sfr`
df_state_init.loc[:, 'sfr']

[11]: ind_dim  (0,)  (1,)  (2,)  (3,)  (4,)  (5,)  (6,)
      grid
      98      0.43  0.38  0.001  0.019  0.029  0.001  0.14
```

```
[12]: # view the second row of `df_forcing`, which is a pandas Series
df_forcing.iloc[1]

[12]: iy      2012.000000
       id      1.000000

```

(continues on next page)

(continued from previous page)

```
isec      0.000000
Name: 2012-01-01 00:10:00, dtype: float64
```

[13]: # view a particular position of `df_forcing`, which is a value
df_forcing.iloc[8,9]

[13]: 4.455

setting new values

Setting new values is very straightforward: after locating the variables/data to modify, just set the new values accordingly:

[14]: # modify surface fractions
df_state_init.loc[:, 'sfr']=[.1,.1,.2,.3,.25,.05,0]
check the updated values
df_state_init.loc[:, 'sfr']

[14]:

ind_dim	(0,)	(1,)	(2,)	(3,)	(4,)	(5,)	(6,)	
grid	98	0.1	0.1	0.2	0.3	0.25	0.05	0.0

1.1.2 Run simulations

Once met-forcing (via df_forcing) and initial conditions (via df_state_init) are loaded in, we call sp.run_supy to conduct a SUEWS simulation, which will return two pandas DataFrames: df_output and df_state.

[15]: df_output, df_state_final = sp.run_supy(df_forcing, df_state_init)

```
INFO:root:=====
INFO:root:Simulation period:
INFO:root: Start: 2012-01-01 00:05:00
INFO:root: End: 2013-01-01 00:00:00
INFO:root:
INFO:root:No. of grids: 1
INFO:root:SuPy is running in serial mode
INFO:root:Execution time: 3.2 s
INFO:root:=====
```

df_output

df_output is an ensemble output collection of major SUEWS output groups, including:

- SUEWS: the essential SUEWS output variables
- DailyState: variables of daily state information
- snow: snow output variables (effective when snowuse = 1 set in df_state_init)

Detailed description of variables in df_output refers to [SuPy output](#)

```
[16]: df_output.columns.levels[0]
[16]: Index(['SUEWS', 'snow', 'RSL', 'DailyState'], dtype='object', name='group')
```

df_state_final

df_state_final is a DataFrame for holding:

1. all model states if save_state is set to True when calling sp.run_supy and supy may run significantly slower for a large simulation;
2. or, only the final state if save_state is set to False (the default setting) in which mode supy has a similar performance as the standalone compiled SUEWS executable.

Entries in df_state_final have the same data structure as df_state_init and can thus be used for other SUEWS simulations starting at the timestamp as in df_state_final.

Detailed description of variables in df_state_final refers to SuPy output

```
[17]: df_state_final.T.head()
[17]:
```

	datetime	2012-01-01 00:05:00	2013-01-01 00:05:00
grid		98	98
var	ind_dim		
ah_min	(0,)	15.0	15.0
	(1,)	15.0	15.0
ah_slope_cooling	(0,)	2.7	2.7
	(1,)	2.7	2.7
ah_slope_heating	(0,)	2.7	2.7

1.1.3 Examine results

Thanks to the functionality inherited from pandas and other packages under the PyData stack, compared with the standard SUEWS simulation workflow, supy enables more convenient examination of SUEWS results by statistics calculation, resampling, plotting (and many more).

Ouptut structure

df_output is organised with MultiIndex (grid,timestamp) and (group,varaible) as index and columns, respectively.

```
[18]: df_output.head()
[18]:
```

group	SUEWS					\
var	Kdown	Kup	Ldown	Lup

[5 rows x 340 columns]

```

Here we demonstrate several typical scenarios for SUEWS results examination.

The essential SUEWS output collection is extracted as a separate variable for easier processing in the following sections. More [advanced slicing techniques](#) are available in `pandas` documentation.

```
[19]: df_output_suews = df_output['SUEWS']
```

Statistics Calculation

We can use `.describe()` method for a quick overview of the key surface energy balance budgets.

```
[20]: df_output_suews.loc[:, ['QN', 'QS', 'QH', 'QE', 'QF']].describe()

[20]: var QN QS QH QE \
count 105408.000000 105408.000000 105408.000000 105408.000000 \
mean 39.319914 -15.810252 88.755915 45.857651 \

50% 82.815455
75% 104.577731
max 162.947824
```

Plotting

Basic example

Plotting is very straightforward via the `.plot` method bounded with `pandas.DataFrame`. Note the usage of `loc` for to slices of the output DataFrame.

```
[21]: # a dict for better display variable names
dict_var_disp = {
    'QN': '$Q^*$',
    'QS': r'$\Delta Q_S$',
    'QE': '$Q_E$',
    'QH': '$Q_H$',
    'QF': '$Q_F$',
    'Kdown': r'$K_{\downarrow}$',
    'Kup': r'$K_{\uparrow}$',
    'Ldown': r'$L_{\downarrow}$',
    'Lup': r'$L_{\uparrow}$',
    'Rain': '$P$',
    'Irr': '$I$',
    'Evap': '$E$',
    'RO': '$R$',
    'TotCh': '$\Delta S$',
}
```

Quick look at the simulation results:

```
[22]: ax_output = df_output_suews\
    .loc[grid]\\
    .loc['2012 6 1':'2012 6 7',\
        ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\\
    .plot()
ax_output.set_xlabel('Date')
```

(continues on next page)

(continued from previous page)

```
[22]: ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')
ax_output.legend()
<matplotlib.legend.Legend at 0x7f8ec14566a0>
```

More examples

Below is a more complete example for examination of urban energy balance over the whole summer (June to August).

```
[23]: # energy balance
ax_output = df_output_suews.loc[grid]\n    .loc['2012 6':'2012 8', ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\n    .plot(\n        figsize=(10, 3),\n        title='Surface Energy Balance',\n    )\n    ax_output.set_xlabel('Date')\n    ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')\n    ax_output.legend()\n<matplotlib.legend.Legend at 0x7f8ed08c3278>
```

Resampling

The suggested runtime/simulation frequency of SUEWS is 300 s, which usually results a large output and may be over-weighted for storage and analysis. Also, you may feel apparent slowdown in producing the above figure as a large amount of data were used for the plotting. To slim down the result size for analysis and output, we can resample the default output very easily.

```
[24]: rsmp_1d = df_output_suews.loc[grid].resample('1d')\n# daily mean values\ndf_1d_mean = rsmp_1d.mean()\n# daily sum values\ndf_1d_sum = rsmp_1d.sum()
```

We can then re-examine the above energy balance at hourly scale and plotting will be significantly faster.

```
[25]: # energy balance
ax_output = df_1d_mean\
    .loc[:, ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\n    .plot(\n        figsize=(10, 3),\n        title='Surface Energy Balance',\n    )\n    ax_output.set_xlabel('Date')\n    ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')\n    ax_output.legend()\n<matplotlib.legend.Legend at 0x7f8ec1623908>
```

Then we use the hourly results for other analyses.

```
[26]: # radiation balance
ax_output = df_1d_mean\
    .loc[:, ['QN', 'Kdown', 'Kup', 'Ldown', 'Lup']]\
    .rename(columns=dict_var_disp)\\
    .plot(
        figsize=(10, 3),
        title='Radiation Balance',
    )
ax_output.set_xlabel('Date')
ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')
ax_output.legend()

[26]: <matplotlib.legend.Legend at 0x7f8eb149a0b8>
```

```
[27]: # water balance
ax_output = df_1d_sum\
    .loc[:, ['Rain', 'Irr', 'Evap', 'RO', 'TotCh']]\
    .rename(columns=dict_var_disp)\\
    .plot(
        figsize=(10, 3),
        title='Surface Water Balance',
    )
ax_output.set_xlabel('Date')
ax_output.set_ylabel('Water amount (mm)')
ax_output.legend()

[27]: <matplotlib.legend.Legend at 0x7f8ef208bc18>
```

Get an overview of partitioning in energy and water balance at monthly scales:

```
[28]: # get a monthly Resampler
df_plot=df_output_suews.loc[grid].copy()
df_plot.index=df_plot.index.set_names('Month')
rsmp_1M = df_plot\
    .shift(-1)\ 
    .dropna(how='all')\
    .resample('1M', kind='period')
# mean values
df_1M_mean = rsmp_1M.mean()
# sum values
df_1M_sum = rsmp_1M.sum()
```

```
[29]: # month names
name_mon = [x.strftime('%b') for x in rsmp_1M.groups]
# create subplots showing two panels together
fig, axes = plt.subplots(2, 1, sharex=True)
# surface energy balance
df_1M_mean\
    .loc[:, ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\\
    .plot(
        ax=axes[0], # specify the axis for plotting
        figsize=(10, 6), # specify figure size
        title='Surface Energy Balance',
        kind='bar',
```

(continues on next page)

(continued from previous page)

```

        )
# surface water balance
df_1M_sum\ 
    .loc[:, ['Rain', 'Irr', 'Evap', 'RO', 'TotCh']]\
    .rename(columns=dict_var_disp)\

The following section was generated from `docs/source/tutorial/impact-studies-parallel.ipynb`

1.2 Impact Studies Using SuPy

1.2.1 Aim

In this tutorial, we aim to perform sensitivity analysis using supy in a parallel mode to investigate the impacts on urban climate of

1. surface properties: the physical attributes of land covers (e.g., albedo, water holding capacity, etc.)

2. background climate: longterm meteorological conditions (e.g., air temperature, precipitation, etc.)

1.2.2 Prepare supy for the parallel mode

load supy and sample dataset

```
[1]: from dask import delayed
from dask import dataframe as dd
import os
import supy as sp
import seaborn as sns
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.dates as mdates
from time import time
import logging
logging.basicConfig()
logging.getLogger().setLevel(logging.WARNING)

get_ipython().run_line_magic('matplotlib', 'inline')
# produce high-quality figures, which can also be set as one of ['svg', 'pdf', 'retina'
# 'png']
# 'svg' produces high quality vector figures
%config InlineBackend.figure_format = 'svg'
# show supy version info
sp.show_version()

supy: 2019.8.30dev
supy_driver: 2019a4
```

```
[2]: # load sample datasets
df_state_init, df_forcing = sp.load_SampleData()
# perform an example run to get output samples for later use
df_output, df_state_final = sp.run_supy(df_forcing, df_state_init)
```

Paralell setup for supy using dask

Given the nature of impact studies that requires multiple independent models with selected parameters/variables varying across the setups, such simulations well fall into the scope of so-called **embarrassingly parallel computation** that is fully supported by dask. Also, as supy is readily built on the data structure `pandas.DataFrame`, we can fairly easily transfer it to the dask framework for parallel operations thanks to ``dask.dataframe <http://docs.dask.org/en/latest/dataframe.html>``, a specialized `dataframe` extending `pandas.DataFrame`'s ability in parallel operations.

Prior to version 2019.5, for a given forcing dataset `df_forcing`, supy would loop over the grids in a `df_state_init` to conduct simulations. Since version 2019.5, supy has been using the `dask.dataframe` to gain the parallel benefits through its parallelized `apply` method.

`dask.dataframe` essentially divides the work into pieces for parallel operations. As such, depending on the number of processors in your computer, it would be more efficient to set the partition number as the multipliers of CPU numbers.

```
[3]: import platform
import psutil
list_info=['machine','system','mac_ver','processor']
for info in list_info:
    info_x=getattr(platform,info)()
    print(info,':',info_x)
cpu_count=psutil.cpu_count()
print('number of CPU processors:',cpu_count)
mem_size=psutil.virtual_memory().total/1024**3
print('memory size (GB):',mem_size)

machine : x86_64
system : Darwin
mac_ver : ('10.14.6', '', '', ''), 'x86_64')
processor : i386
number of CPU processors: 12
memory size (GB): 32.0
```

To demonstrate the parallelization, we simply duplicate the contents in `df_state_init` to make it seemingly large. Note we intentionally choose 24 as the number for copies to accompany the power of CPU.

Before we move on to the parallel mode, we perform a simulation in the traditional serial way to see the baseline performance.

Baseline serial run

```
[4]: # just run for 30 days
df_forcing_part = df_forcing.iloc[:288*30]
df_state_init_mgrids = df_state_init.copy()
# construct a multi-grid `df_state_init`
for i in range(24-1):
    df_state_init_mgrids = df_state_init_mgrids.append(
        df_state_init, ignore_index=True)
# perform a serial run
t0 = time()
for i in range(24-1):
    xx = sp.run_supy(df_forcing_part, df_state_init_mgrids.iloc[[i]])
t1 = time()
t_ser = t1-t0
logging.warning(f'Execution time: {t_ser:.2f} s')
```

WARNING:root:Execution time: 7.61 s

Parallel run

```
[5]: # parallel run is enabled in supy by default
t0 = time()
xx = sp.run_supy(df_forcing_part, df_state_init_mgrids)
t1 = time()
t_par = t1-t0
logging.warning(f'Execution time: {t_par:.2f} s')

WARNING:root:Execution time: 4.13 s
```

Benchmark test

Note: this test may take a considerably long time depending on the machine performance

```
[6]: # different running length
list_sim_len = [
    day * 288 for day in [30, 90, 120, 150, 180, 270, 365, 365 * 2, 365 * 3]
]

# number of test grids
n_grid = 12

# construct a multi-grid `df_state_init`
df_state_init_m = df_state_init.copy()
for i in range(n_grid - 1):
    df_state_init_m = df_state_init_m.append(df_state_init, ignore_index=True)

# construct a longer`df_forcing` for three years
df_forcing_m = pd.concat([df_forcing for i in range(3)])
df_forcing_m.index = pd.date_range(df_forcing.index[0],
                                    freq=df_forcing.index.freq,
                                    periods=df_forcing_m.index.size)

dict_time_ser = dict()
dict_time_par = dict()
for sim_len in list_sim_len:
    df_forcing_part = df_forcing_m.iloc[:sim_len]
    logging.warning(f'Sim days: {sim_len / 288}')
    logging.warning(f'No. of grids: {df_state_init_m.shape[0]}')
    # serial run
    logging.warning('serial:')
    t0 = time()
    for i in range(df_state_init_m.shape[0]):
        sp.run_supy(df_forcing_part, df_state_init_m.iloc[[i]])
    t1 = time()
    t_test = t1 - t0
    logging.warning(f'Execution time: {t_test:.2f} s')

    dict_time_ser.update({sim_len: t_test})

    # parallel run
    logging.warning('parallel:')
    t0 = time()

ax.right_ax.set_ylabel('Execution Ratio (=p/s)', color='C2')
ax.right_ax.spines['right'].set_color('C2')
ax.right_ax.tick_params(axis='y', colors='C2')
```

1.2.3 Surface properties: surface albedo

Examine the default albedo values loaded from the sample dataset

```
[8]: df_state_init.alb
```

```
[8]: ind_dim  (0,)  (1,)  (2,)  (3,)  (4,)  (5,)  (6,)
grid
98        0.12  0.15  0.12  0.18  0.21  0.21  0.1
```

Copy the initial condition DataFrame to have a *clean slate* for our study

Note: DataFrame.copy() defaults to deepcopy

```
[9]: df_state_init_test = df_state_init.copy()
```

Set the Bldg land cover to 100% for this study

```
[10]: df_state_init_test.sfr = 0
df_state_init_test.loc[:, ('sfr', '(1,))'] = 1
df_state_init_test.sfr
```

```
[10]: ind_dim  (0,)  (1,)  (2,)  (3,)  (4,)  (5,)  (6,)
grid
98          0      1      0      0      0      0      0
```

Construct a `df_state_init_x` dataframe to perform `supy` simulation with specified albedo

```
[11]: # create a `df_state_init_x` with different surface properties
n_test = 48
list_alb_test = np.linspace(0.1, 0.8, n_test).round(2)
df_state_init_x = df_state_init_test.append(
    [df_state_init_test]*(n_test-1), ignore_index=True)

# here we modify surface albedo
df_state_init_x.loc[:, ('alb', '(1,)')] = list_alb_test
```

Conduct simulations with `supy`

```
[12]: df_forcing_part = df_forcing.loc['2012 01':'2012 07']
df_res_alb_test, df_state_final_x = sp.run_supy(df_forcing_part, df_state_init_x)
```

Examine the simulation results

```
[13]: # choose results of July 2012 for analysis
df_res_alb_test_july=df_res_alb_test.SUEWS.unstack(0).loc['2012 7']
df_res_alb_T2_stat = df_res_alb_test_july.T2.describe()
df_res_alb_T2_diff = df_res_alb_T2_stat.transform(
    lambda x: x - df_res_alb_T2_stat.iloc[:, 0])
df_res_alb_T2_diff.columns = list_alb_test-list_alb_test[0]
```

```
[14]: ax_temp_diff = df_res_alb_T2_diff.loc[['max', 'mean', 'min']].T.plot()
ax_temp_diff.set_ylabel('$\Delta T_2$ ($^\circ C$)')
ax_temp_diff.set_xlabel(r'$\Delta \alpha$')
ax_temp_diff.margins(x=0.2, y=0.2)
```

Why a bi-linear $\Delta\alpha - \Delta T_{2,max}$ relationship?

Although the relations for mean and minimum T_2 demonstrate single linear patterns, the one for maximum T_2 , interestingly, consists of two linear sections.

```
[15]: df_t2=df_res_alb_test_july.T2
df_t2.columns=list_alb_test

df_t2.idxmax().unique()

[15]: array(['2012-07-25T13:35:00.000000000', '2012-07-25T15:30:00.000000000'],
           dtype='datetime64[ns]')
```

By looking into the peaking times of $T_{2,max}$, we see a shift in the peaking times from 13:35 to 15:30 on 2012-07-25 as albedo increases. Taking the two ending cases, $\alpha = 0.1$ and $\alpha = 0.8$, we see diurnal cycles of T_2 evolves according to the albedo: peak is delayed as albedo increases.

```
[16]: df_t2.loc['2012-07-25'].iloc[:, [0, -1]].plot()  
[16]: <matplotlib.axes._subplots.AxesSubplot at 0x7f9630da73c8>
```

Furthermore, when the $\Delta\alpha - \Delta T_2$ relations at the two peaking times are shown below, we can see the bi-linear relation based on the $T_{2,max}$ values for the July 2012 is actually composed of two linear relations at different times under different peaking scenarios.

```
[17]: ax_t2_max=df_t2.loc['2012-07-25 13:35':'2012-07-25 15:30'].iloc[[0, -1]].T.plot()  
ax_t2_max.set_xlabel(r'$\alpha$')  
ax_t2_max.set_ylabel('$T_{2,max}^{\circ C}$')  
  
[17]: Text(0, 0.5, '$T_{2,max}^{\circ C}$')
```

1.2.4 Background climate: air temperature

Examine the monthly climatology of air temperature loaded from the sample dataset

```
[18]: df_plot = df_forcing.Tair.iloc[:-1].resample('1m').mean()  
ax_temp = df_plot.plot.bar(color='tab:blue')  
ax_temp.set_xticklabels(df_plot.index.strftime('%b'))  
ax_temp.set_ylabel('Mean Air Temperature ($^\circ C$)')  
ax_temp.set_xlabel('Month')  
ax_temp  
  
[18]: <matplotlib.axes._subplots.AxesSubplot at 0x7f9630d7f668>
```

Construct a function to perform parallel supy simulation with specified diff_airtemp_test: the difference in air temperature between the one used in simulation and loaded from sample dataset.

Note: forcing data “df_forcing“ has different data structure from “df_state_init“; so we need to modify “run_supy_mgrids“ to implement a “run_supy_mcclims“ for different climate scenarios

Let’s start the implementation of run_supy_mcclims with a small problem of four forcing groups (i.e., climate scenarios), where the air temperatures differ from the baseline scenario with a constant bias.

```
[19]: # save loaded sample datasets  
df_forcing_part_test = df_forcing.loc['2012 1':'2012 7'].copy()  
df_state_init_test = df_state_init.copy()
```

```
[20]: # create a dict with four forcing conditions as a test  
n_test = 4  
list_TairDiff_test = np.linspace(0., 2, n_test).round(2)  
dict_df_forcing_x = {  
    tairdiff: df_forcing_part_test.copy()  
    for tairdiff in list_TairDiff_test}  
for tairdiff in dict_df_forcing_x:
```

(continues on next page)

(continued from previous page)

```

dict_df_forcing_x[tairdiff].loc[:, 'Tair'] += tairdiff

dd_forcing_x = {
    k: delayed(sp.run_supy)(df, df_state_init_test)[0]
    for k, df in dict_df_forcing_x.items()
}

df_res_tairdiff_test0 = delayed(pd.concat)(
    dd_forcing_x,
    keys=list_TairDiff_test,
    names=['tairdiff'],
)

```

```
[21]: # test the performance of a parallel run
t0 = time()
df_res_tairdiff_test = df_res_tairdiff_test0\
    .compute(scheduler='threads')\
    .reset_index('grid', drop=True)
t1 = time()
t_par = t1 - t0
print(f'Execution time: {t_par:.2f} s')

Execution time: 6.83 s
```

```
[22]: # function for multi-climate `run_supy`
# wrapping the above code into one
def run_supy_mclims(df_state_init, dict_df_forcing_mclims):
    dd_forcing_x = {
        k: delayed(sp.run_supy)(df, df_state_init_test)[0]
        for k, df in dict_df_forcing_x.items()
    }
    df_output_mclims0 = delayed(pd.concat)(
        dd_forcing_x,
        keys=list(dict_df_forcing_x.keys()),
        names=['clm'],
    ).compute(scheduler='threads')
    df_output_mclims = df_output_mclims0.reset_index('grid', drop=True)

    return df_output_mclims
```

Construct `dict_df_forcing_x` with multiple forcing DataFrames

```
[23]: # save loaded sample datasets
df_forcing_part_test = df_forcing.loc['2012 1':'2012 7'].copy()
df_state_init_test = df_state_init.copy()

# create a dict with a number of forcing conditions
n_test = 24 # can be set with a smaller value to save simulation time
list_TairDiff_test = np.linspace(0., 2, n_test).round(2)
dict_df_forcing_x = {
    tairdiff: df_forcing_part_test.copy()
    for tairdiff in list_TairDiff_test}
for tairdiff in dict_df_forcing_x:
    dict_df_forcing_x[tairdiff].loc[:, 'Tair'] += tairdiff
```

Perform simulations

```
[24]: # run parallel simulations using `run_supy_mcclims`  
t0 = time()  
df_airtemp_test_x = run_supy_mcclims(df_state_init_test, dict_df_forcing_x)  
t1 = time()  
t_par = t1-t0  
print(f'Execution time: {t_par:.2f} s')  
  
Execution time: 38.52 s
```

Examine the results

```
[25]: df_airtemp_test = df_airtemp_test_x.SUEWS.unstack(0)  
df_temp_diff=df_airtemp_test.T2.transform(lambda x: x - df_airtemp_test.T2[0.0])  
df_temp_diff_ana=df_temp_diff.loc['2012 7']  
df_temp_diff_stat=df_temp_diff_ana.describe().loc[['max', 'mean', 'min']].T  
  
[26]: ax_temp_diff_stat=df_temp_diff_stat.plot()  
ax_temp_diff_stat.set_ylabel('$\Delta T_2$ ($^\circ C$)')  
ax_temp_diff_stat.set_xlabel('$\Delta T_a$ ($^\circ C$)')  
ax_temp_diff_stat.set_aspect('equal')
```

The T_2 results indicate the increased T_a has different impacts on the T_2 metrics (minimum, mean and maximum) but all increase linearly with T_a . The maximum T_2 has the stronger response compared to the other metrics.

The following section was generated from docs/source/tutorial/external-interaction.ipynb

1.3 Interaction between SuPy and external models

1.3.1 Introduction

SUEWS can be coupled to other models that provide or require forcing data using the SuPy single timestep running mode. We demonstrate this feature with a simple online anthropogenic heat flux model.

Anthropogenic heat flux (Q_F) is an additional term to the surface energy balance in urban areas associated with human activities (Gabey et al., 2018; Grimmond, 1992; Nie et al., 2014; 2016; Sailor, 2011). In most cities, the largest emission source is from buildings (Hamilton et al., 2009; Iamarino et al., 2011; Sailor, 2011) and is highly dependent on outdoor ambient air temperature.

1.3.2 a simple QF model: QF_simple

model description

For demonstration purposes we have created a very simple model instead of using the SUEWS Q_F (Järvi et al. 2011) with feedback from outdoor air temperature. The simple Q_F model considers only building heating and cooling:

$$Q_F = \begin{cases} (T_2 - T_C) \times C_B, & T_2 > T_C \\ (T_H - T_2) \times H_B, & T_2 < T_H \\ Q_{F0} & \end{cases}$$

where T_C (T_H) is the cooling (heating) threshold temperature of buildings, C_B (H_B) is the building cooling (heating) rate, and Q_{F0} is the baseline anthropogenic heat. The parameters used are: T_C (T_H) set as 20 °C (10 °C), C_B (H_B) set as 1.5 W m⁻² K⁻¹ (3 W m⁻² K⁻¹) and Q_{F0} is set as 0 W m⁻², implying other building activities (e.g. lightning, water heating, computers) are zero and therefore do not change the temperature or change with temperature.

implementation

```
[4]: def QF_simple(T2):
    qf_cooling = (T2-20)*5 if T2 > 20 else 0
    qf_heating = (10-T2)*10 if T2 < 10 else 0
    qf_res = np.max([qf_heating, qf_cooling])*0.3
    return qf_res
```

Visualise the QF_simple model:

```
[6]: ser_temp = pd.Series(np.arange(-5, 45, 0.5),
                       index=np.arange(-5, 45, 0.5)).rename('temp_C')
ser_qf_heating = ser_temp.loc[-5:10].map(QF_simple).rename(
    r'heating: $(T_H-T_a) \times H_B$')
ser_qf_cooling = ser_temp.loc[20:45].map(QF_simple).rename(
    r'cooling: $(T_a-T_C) \times C_B$')
ser_qf_zero = ser_temp.loc[10:20].map(QF_simple).rename('baseline: $Q_{F0}$')
df_temp_qf = pd.concat([ser_temp, ser_qf_cooling, ser_qf_heating, ser_qf_zero],
                       axis=1).set_index('temp_C')
ax_qf_func = df_temp_qf.plot()
ax_qf_func.set_xlabel('$T_2$ ($^{\circ}\text{C}$)')
ax_qf_func.set_ylabel('$Q_F$ ($\text{W m}^{-2}$))'
ax_qf_func.legend(title='simple $Q_F$')

        patchA=None,
        patchB=None,
        connectionstyle='arc3, rad=-0.3',
),
)
ax_qf_func.plot(10, 0, 'o', color='C1', fillstyle='none')
= ax_qf_func.plot(20, 0, 'o', color='C0', fillstyle='none')

```

1.3.3 communication between supy and QF_simple

construct a new coupled function

The coupling between the simple Q_F model and SuPy is done via the low-level function `suews_cal_tstep`, which is an interface function in charge of communications between SuPy frontend and the calculation kernel. By setting

SuPy to receive external Q_F as forcing, at each timestep, the simple Q_F model is driven by the SuPy output T_2 and provides SuPy with Q_F , which thus forms a two-way coupled loop.

```
[7]: # load extra low-level functions from supy to construct interactive functions
from supy._post import pack_df_output, pack_df_state
from supy._run import suews_cal_tstep, pack_grid_dict

def run_supy_qf(df_forcing_test, df_state_init_test):
    grid = df_state_init_test.index[0]
    df_state_init_test.loc[grid, 'emissionsmethod'] = 0

    df_forcing_test = df_forcing_test\
        .assign(
            metforcingdata_grid=0,
            ts5mindata_ir=0,
        )\
        .rename(

simulations for summer and winter months

The simulation using SuPy coupled is performed for London 2012. The data analysed are a summer (July) and a winter (December) month. Initially Q_F is 0 W m⁻² the T_2 is determined and used to determine $Q_{F[1]}$ which in turn modifies $T_{2[1]}$ and therefore modifies $Q_{F[2]}$ and the diagnosed $T_{2[2]}$.

```

The above figure indicate a positive feedback, as Q_F is increased there is an elevated T_2 but with different magnitudes given the non-linearity in the SUEWS modelling system. Of particular note is the positive feedback loop under warm air temperatures: the anthropogenic heat emissions increase which in turn elevates the outdoor air temperature causing yet more anthropogenic heat release. Note that London is relatively cool so the enhancement is much less than it would be in warmer cities.

End of doc/tutorial/external-interaction.ipynb

The following section was generated from `docs/source/tutorial/AMF-sim.ipynb`

1.4 Modelling Surface Energy Balance at an AmeriFlux Site Using SuPy

This tutorial aims to demonstrate how to use an advanced land surface model (SuPy, SUEWS in Python) to better understand the surface energy balance (SEB) features by conducting simulation at an AmeriFlux site. This would be particularly useful after building your own model: as you will learn how sophisticated models could be developed from those simpler ones.

SuPy is a Python-enhanced urban climate model with SUEWS, *Surface Urban Energy and Water Balance Scheme*, as its computation core. More SuPy tutorials are available [here](#).

In this tutorial the workflow to model the surface energy balance (SEB) at a chosen AmeriFlux (AMF) site using SuPy/SUEWS is undertaken. The steps, consist of

1. *Preparing the input data;*
2. *Running a simulation;*
3. *Examination of results;* and
4. *Further exploration*

Before starting, you need to install SuPy and load the following necessary packages.

```
pip install supy==2019.11.18.dev0
```

```
[1]: # !pip install supy==2019.11.18.dev0 &> install.log
```

```
[2]: import matplotlib.pyplot as plt
import supy as sp
import pandas as pd
import numpy as np
from pathlib import Path
%matplotlib inline
```

```
[3]: %load_ext autoreload
%autoreload 2
```

```
[4]: sp.show_version()
supy: 2019.11.18dev
supy_driver: 2019a18
```

1.4.1 Prepare input data

Overview of SuPy input

Load sample data:

To ease the preparation of model input, a helper function `load_SampleData` is provided to get the sample input for SuPy simulations, which will later be used as template to populate your specific model configurations and forcing input.

```
[5]: df_state_init, df_forcing = sp.load_SampleData()  
2019-11-22 09:16:28,573 -- SuPy -- INFO -- All cache cleared.
```

df_state_init

df_state_init includes model Initial state consisting of:

- surface characteristics (e.g., albedo, emissivity, land cover fractions, etc.; full details refer to SUEWS documentation).
- model configurations (e.g., stability; full details refer to SUEWS documentation).

Detailed description of variables in df_state_init refers to *SuPy input*.

- Surface land cover fraction information in the sample input dataset:

```
[6]: df_state_init.filter(like='sfr')  
  
[6]: var      sfr  
ind_dim  (0,)  (1,)  (2,)  (3,)  (4,)  (5,)  (6,)  
grid  
98      0.43  0.38  0.001  0.019  0.029  0.001  0.14
```

- Heights of bluff-bodies (m):

```
[7]: df_state_init.loc[:, ['bldgh', 'evetreeh', 'dectreeh']]  
  
[7]: var      bldgh  dectreeh  evetreeh  
ind_dim      0        0        0  
grid  
98      22.0    13.1    13.1
```

df_forcing

df_forcing includes meteorological and other external forcing information.

Detailed description of variables in df_forcing refers to *SuPy input*.

Below is a view of heading lines of the forcing variables.

```
[8]: df_forcing.head()  
  
[8]:          iy  id  it  imin    qn    qh    qe    qs    qf  \

Site-specific configuration of surface parameters

Given `pandas.DataFrame` as the core data structure of SuPy, all operations, including modification, output, demonstration, etc., on SuPy inputs (`df_state_init` and `df_forcing`) can be done using `pandas`-based functions/methods. Please see [SuPy quickstart](#) for methods to do so.

Below we will modify several key properties of the chosen site with appropriate values to run SuPy. First, we copy the `df_state_init` to have a new DataFrame for manipulation.

```
[9]: df_state_amf = df_state_init.copy()
```

```
[10]: # site identifier
name_site = 'US-AR1'
```

location

```
[11]: # latitude
df_state_amf.loc[:, 'lat'] = 41.37
# longitude
df_state_amf.loc[:, 'lng'] = -106.24
# altitude
df_state_amf.loc[:, 'alt'] = 611.
```

land cover fraction

Land covers in SUEWS

```
[12]: # view the surface fraction variable: `sfr`
df_state_amf.loc[:, 'sfr'] = 0
df_state_amf.loc[:, ('sfr', '(4,))'] = 1
df_state_amf.loc[:, 'sfr']

[12]: ind_dim  (0,)  (1,)  (2,)  (3,)  (4,)  (5,)  (6,)
      grid
      98      0.0    0.0    0.0    0.0    1.0    0.0    0.0
```

albedo

```
[13]: # we only set values for grass as the modelled site has a single land cover type: grass.  
df_state_amf.albmax_grass = 0.19  
df_state_amf.albmin_grass = 0.14
```

```
[14]: # initial albedo value  
df_state_amf.loc[:, 'albgrass_id'] = 0.14
```

LAI/phenology

```
[15]: df_state_amf.filter(like='lai')  
  
[15]: var      laimax      laimin      laipower ... \\\nind_dim  (0,) (1,) (2,)  (0,) (1,) (2,)  (0, 0) (0, 1) (0, 2) (1, 0) ...  
grid  
98       5.1   5.5   5.9    4.0   1.0   1.6     0.03   0.03   0.03  0.0005 ...  
  
var          laitype      laicalcyes lai_id  
ind_dim  (3, 0)  (3, 1)  (3, 2)  (0,) (1,) (2,)           0  (0,) (1,) (2,)  
grid  
98       0.0005  0.0005  0.0005    0.0   0.0   0.0           1   4.0   1.0  1.6  
  
[1 rows x 25 columns]
```

```
[16]: # properties to control vegetation phenology  
# you can skip the details for and just set them as provided below  
  
# LAI paramters  
df_state_amf.loc[:, ('laimax', '(2,)')] = 1  
df_state_amf.loc[:, ('laimin', '(2,)')] = 0.2  
# initial LAI  
df_state_amf.loc[:, ('lai_id', '(2,)')] = 0.2  
  
# BaseT  
df_state_amf.loc[:, ('baset', '(2,)')] = 5  
# BaseTe  
df_state_amf.loc[:, ('baseTe', '(2,)')] = 20  
  
# SDDFull  
df_state_amf.loc[:, ('sddfull', '(2,)')] = -1000  
# GDDFull  
df_state_amf.loc[:, ('gddfull', '(2,)')] = 1000
```

surface resistance

```
[17]: # parameters to model surface resistance  
df_state_amf.maxconductance = 18.7  
df_state_amf.g1 = 1  
df_state_amf.g2 = 104.215  
df_state_amf.g3 = 0.424  
df_state_amf.g4 = 0.814  
df_state_amf.g5 = 36.945  
df_state_amf.g6 = 0.025
```

measurement height

```
[18]: # height where forcing variables are measured/collected
df_state_amf.z = 2.84
```

urban feature

```
[19]: # disable anthropogenic heat by setting zero population
df_state_amf.popdensdaytime = 0
df_state_amf.popdensnighttime = 0
```

check df_state

```
[20]: # this procedure is to double-check proper values are set in `df_state_amf`
sp.check_state(df_state_amf)

2019-11-22 09:16:30,954 -- SuPy -- INFO -- SuPy is validating `df_state`...
2019-11-22 09:16:31,120 -- SuPy -- INFO -- All checks for `df_state` passed!
```

prepare forcing conditions

Here we use the a SuPy utility function `read_forcing` to read in forcing data from an external file in the format of SUEWS input. Also note, this `read_forcing` utility will also resample the forcing data to a proper temporal resolution to run SuPy/SUEWS, which is usually 5 min (300 s).

load and resample forcing data

```
[21]: # load forcing data from an external file and resample to a resolution of 300 s.
# Note this dataset has been gap-filled.
df_forcing_amf = sp.util.read_forcing('./data/US-AR1_2010_data_60.txt',
                                         tstep_mod=300)

# this procedure is to double-check proper forcing values are set in `df_forcing_amf`
_ = sp.check_forcing(df_forcing_amf)

2019-11-22 09:16:32,059 -- SuPy -- INFO -- SuPy is validating `df_forcing`...
2019-11-22 09:16:34,374 -- SuPy -- ERROR -- Issues found in `df_forcing`:
`kdown` should be between [0, 1400] but `-1.3057500000000002` is found at 2010-01-01_
→00:05:00
```

The checker detected invalid values in variable `kdown`: negative incoming solar radiation is found. We then need to fix this as follows:

```
[22]: # modify invalid values
df_forcing_amf.kdown = df_forcing_amf.kdown.where(df_forcing_amf.kdown > 0, 0)
```

```
[23]: # check `df_forcing` again
_ = sp.check_forcing(df_forcing_amf)
```

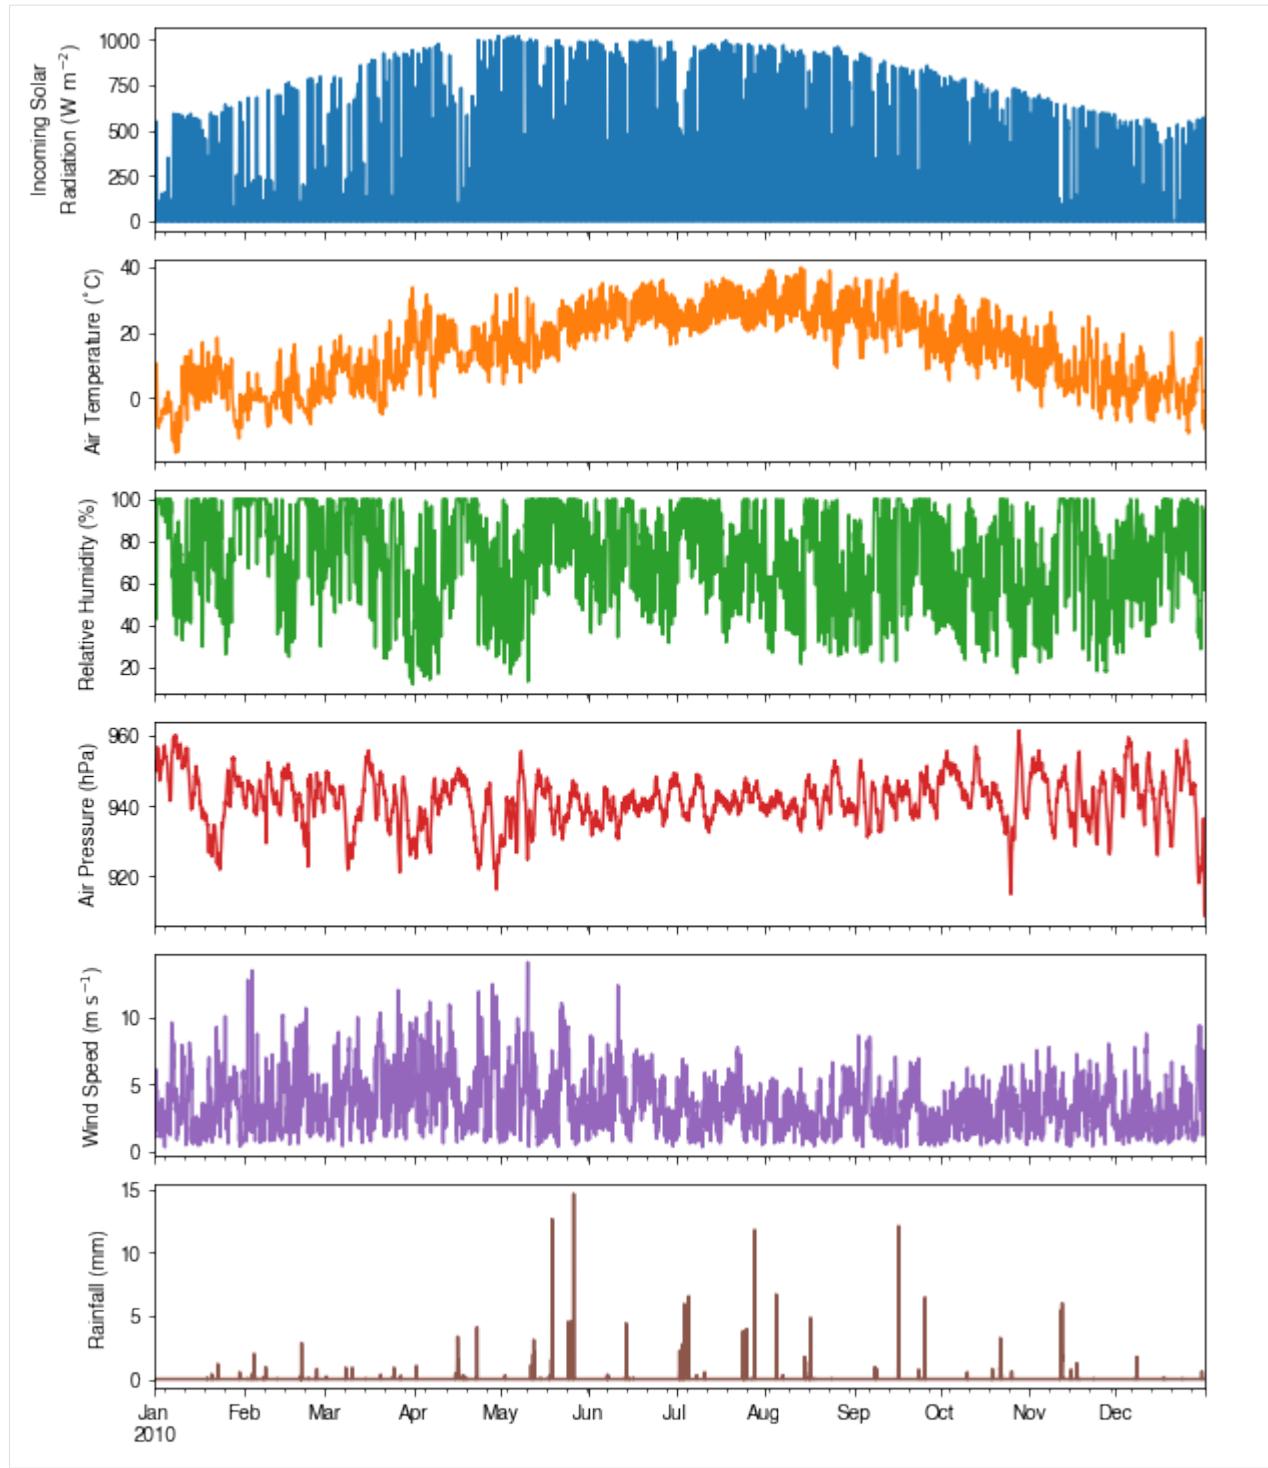

```
2019-11-22 09:16:34,466 -- SuPy -- INFO -- SuPy is validating `df_forcing`...
2019-11-22 09:16:36,946 -- SuPy -- INFO -- All checks for `df_forcing` passed!
```

examine forcing data

We can examine the forcing data:

```
[24]: list_var_forcing = [
    'kdown',
    'Tair',
    'RH',
    'pres',
    'U',
    'rain',
]
dict_var_label = {
    'kdown': 'Incoming Solar\n Radiation ($ \mathrm{W \ m^{-2}} )',
    'Tair': 'Air Temperature ($^{\circ}\mathrm{C})',
    'RH': r'Relative Humidity (%)',
    'pres': 'Air Pressure (hPa)',
    'rain': 'Rainfall (mm)',
    'U': 'Wind Speed (m \mathrm{s^{-1}} )'
}
df_plot_forcing_x = df_forcing_amf.loc[:, list_var_forcing].copy().shift(
    -1).dropna(how='any')
df_plot_forcing = df_plot_forcing_x.resample('1h').mean()
df_plot_forcing['rain'] = df_plot_forcing_x['rain'].resample('1h').sum()

axes = df_plot_forcing.plot(
    subplots=True,
    figsize=(8, 12),
    legend=False,
)
fig = axes[0].figure
fig.tight_layout()
fig.autofmt_xdate(bottom=0.2, rotation=0, ha='center')
for ax, var in zip(axes, list_var_forcing):
    _ = ax.set_ylabel(dict_var_label[var])
```

1.4.2 Run simulations

Once met-forcing (via `df_forcing_amf`) and initial conditions (via `df_state_amf`) are loaded in, we call `sp.run_supy` to conduct a SUEWS simulation, which will return two pandas DataFrames: `df_output` and `df_state_final`.

```
[25]: df_output, df_state_final = sp.run_supy(df_forcing_amf, df_state_amf)

2019-11-22 09:16:40,809 -- SuPy -- INFO -- =====

```

df_output

df_output is an ensemble output collection of major SUEWS output groups, including:

- SUEWS: the essential SUEWS output variables
- DailyState: variables of daily state information
- snow: snow output variables (effective when snowuse = 1 set in df_state_init)
- RSL: profile of air temperature, humidity and wind speed within roughness sub-layer.

Detailed description of variables in df_output refers to [SuPy output](#)

```
[26]: df_output.columns.levels[0]
[26]: Index(['SUEWS', 'snow', 'RSL', 'DailyState'], dtype='object', name='group')
```

df_state_final

df_state_final is a DataFrame for holding:

1. all model states if save_state is set to True when calling sp.run_supy and supy may run significantly slower for a large simulation;
2. or, only the final state if save_state is set to False (the default setting) in which mode supy has a similar performance as the standalone compiled SUEWS executable.

Entries in df_state_final have the same data structure as df_state_init and can thus be used for other SUEWS simulations starting at the timestamp as in df_state_final.

Detailed description of variables in df_state_final refers to [SuPy output](#)

```
[27]: df_state_final.T.head()
[27]:      datetime           2010-01-01 00:05:00 2011-01-01 00:05:00
      grid                           98                      98
      var      ind_dim
      ah_min        (0,)                  15.0                 15.0
                    (1,)                  15.0                 15.0
      ah_slope_cooling  (0,)                  2.7                  2.7
                    (1,)                  2.7                  2.7
      ah_slope_heating  (0,)                  2.7                  2.7
```

1.4.3 Examine results

Thanks to the functionality inherited from pandas and other packages under the PyData stack, compared with the standard SUEWS simulation workflow, supy enables more convenient examination of SUEWS results by statistics calculation, resampling, plotting (and many more).

Output structure

`df_output` is organised with MultiIndex (`grid, timestamp`) and (`group, varable`) as index and columns, respectively.

[28]: `df_output.head()`

group		SUEWS						\	
var	grid datetime	Kdown	Kup	Ldown	Lup	Tsurf	...	\

(continues on next page)

(continued from previous page)

```
[5 rows x 345 columns]
```

Here we demonstrate several typical scenarios for SUEWS results examination.

The essential SUEWS output collection is extracted as a separate variable for easier processing in the following sections. More [advanced slicing techniques](#) are available in `pandas` documentation.

```
[29]: grid = df_state_amf.index[0]
df_output_suews = df_output.loc[grid, 'SUEWS']
```

Statistics Calculation

We can use `.describe()` method for a quick overview of the key surface energy balance budgets.

```
[30]: df_output_suews.loc[:, ['QN', 'QS', 'QH', 'QE', 'QF']].describe()
```

	QN	QS	QH	QE	QF
count	105120.000000	105120.000000	105120.000000	105120.000000	105120.0
mean	118.291222	9.117453	53.611159	56.302547	0.0
std	213.150698	82.433076	72.044586	93.959856	0.0
min	-98.895138	-103.332153	-136.770097	-10.592811	0.0
25%	-32.252113	-46.922708	9.790903	0.633106	0.0
50%	-1.216564	-33.883630	25.756834	4.240341	0.0
75%	247.458581	55.231281	75.382465	67.207728	0.0
max	746.187700	262.700179	403.492712	445.496829	0.0

Plotting

Basic example

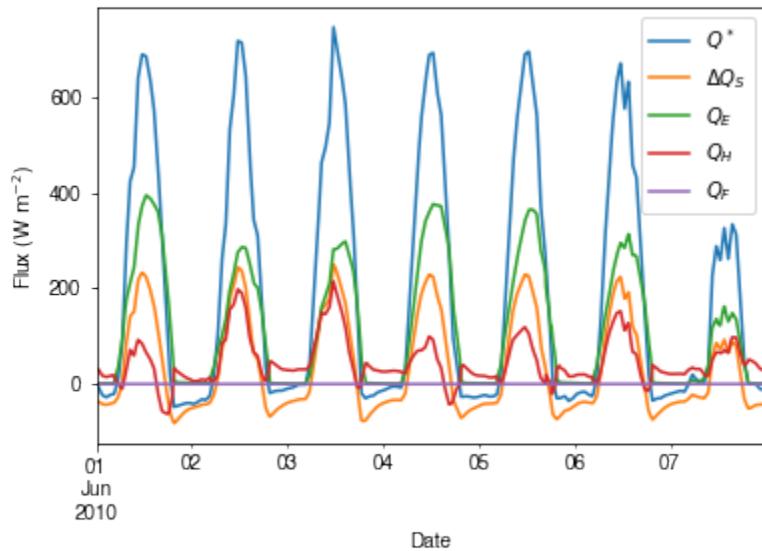

Plotting is very straightforward via the `.plot` method bounded with `pandas.DataFrame`. Note the usage of `loc` for to slices of the output DataFrame.

```
[31]: # a dict for better display variable names
dict_var_disp = {
    'QN': '$Q^*$',
    'QS': r'$\Delta Q_S$',
    'QE': '$Q_E$',
    'QH': '$Q_H$',
    'QF': '$Q_F$',
    'Kdown': r'$K_{\downarrow}$',
    'Kup': r'$K_{\uparrow}$',
    'Ldown': r'$L_{\downarrow}$',
    'Lup': r'$L_{\uparrow}$',
    'Rain': '$P$',
    'Irr': '$IS$',
    'Evap': '$E$',
    'RO': '$R$',
    'TotCh': '$\Delta S$',
}
```

Peek at the simulation results:

```
[32]: grid = df_state_init.index[0]
```

```
[33]: ax_output = df_output_suews\ 
    .loc['2010-06-01':'2010-06-07', 
        ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\ 
    .plot()
_= ax_output.set_xlabel('Date')
_= ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')
_= ax_output.legend()
```

Plotting after resampling

The suggested runtime/simulation frequency of SUEWS is 300 s, which usually results a large output and may be over-weighted for storage and analysis. Also, you may feel apparent slowdown in producing the above figure as a large amount of data were used for the plotting. To slim down the result size for analysis and output, we can resample the default output very easily.

```
[34]: rsmp_1d = df_output_suews.resample('1d')
# daily mean values
df_1d_mean = rsmp_1d.mean()
# daily sum values
df_1d_sum = rsmp_1d.sum()
```

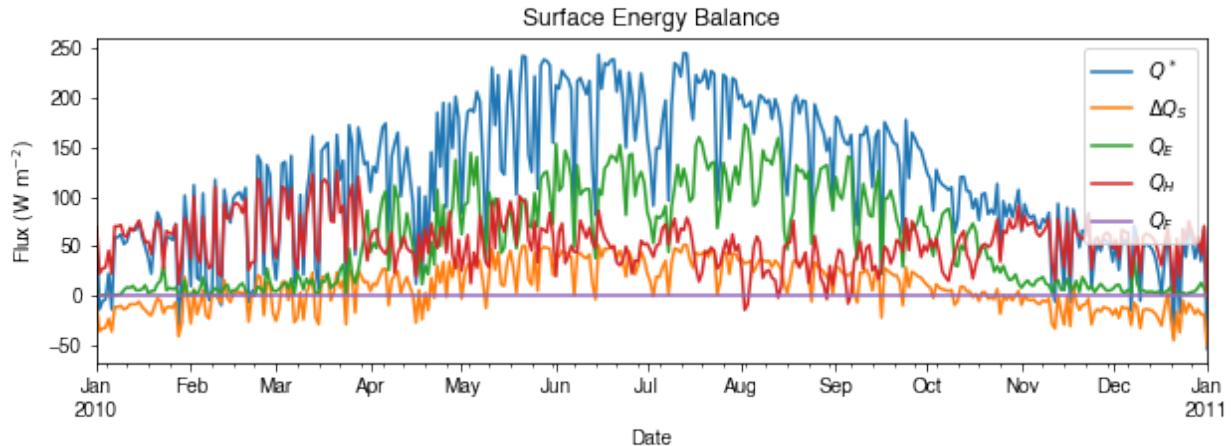

We can then re-examine the above energy balance at hourly scale and plotting will be significantly faster.

```
[35]: # energy balance
ax_output = df_1d_mean\
    .loc[:, ['QN', 'QS', 'QE', 'QH', 'QF']]\
    .rename(columns=dict_var_disp)\ 
    .plot(
        figsize=(10, 3),
        title='Surface Energy Balance',
    )
_= ax_output.set_xlabel('Date')
```

(continues on next page)

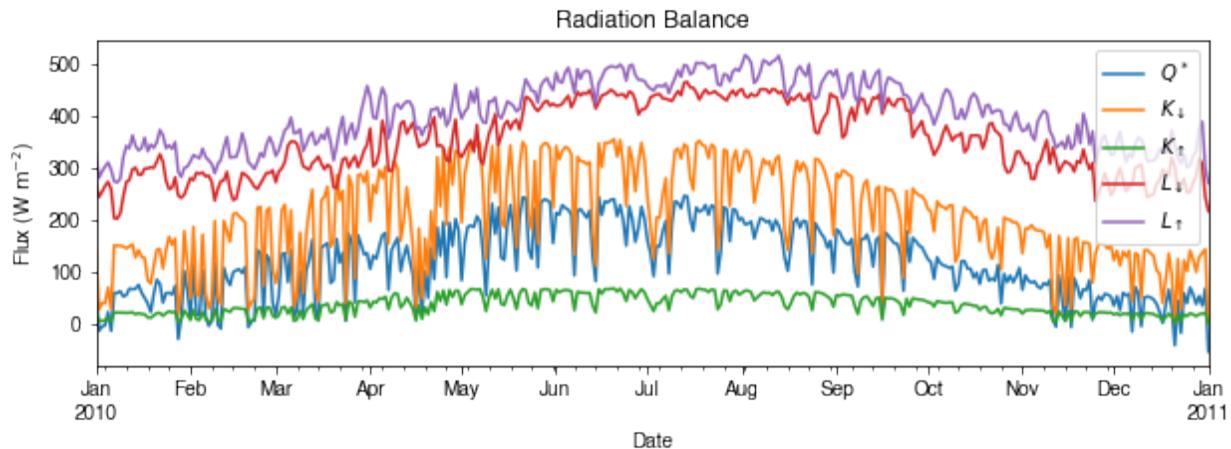

(continued from previous page)

```
_ = ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')
_= ax_output.legend()
```

Then we use the hourly results for other analyses.

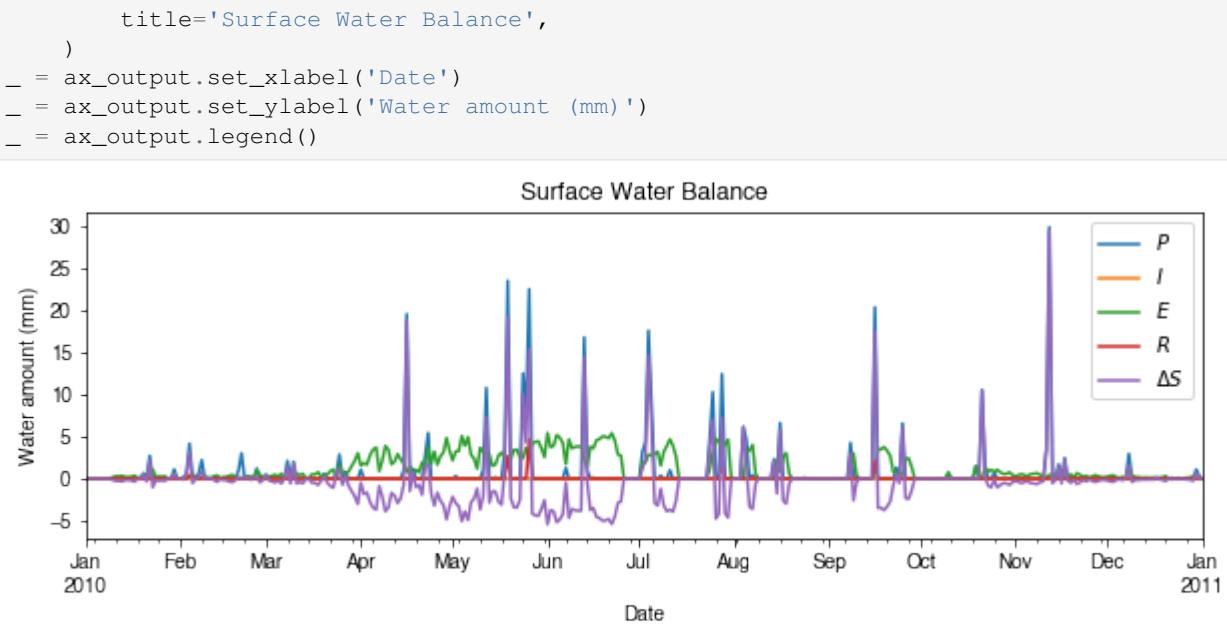

```
[36]: # radiation balance
ax_output = df_1d_mean\ 
    .loc[:, ['QN', 'Kdown', 'Kup', 'Ldown', 'Lup']]\
    .rename(columns=dict_var_disp)\ 
    .plot(
        figsize=(10, 3),
        title='Radiation Balance',
    )
_= ax_output.set_xlabel('Date')
_= ax_output.set_ylabel('Flux ($ \mathrm{W} \mathrm{m}^{-2} $)')
_= ax_output.legend()
```

```
[37]: # water balance
ax_output = df_1d_sum\ 
    .loc[:, ['Rain', 'Irr', 'Evap', 'RO', 'TotCh']]\
    .rename(columns=dict_var_disp)\ 
    .plot(
        figsize=(10, 3),
```

(continues on next page)

(continued from previous page)

Get an overview of partitioning in energy and water balance at monthly scales:

```
[38]: # get a monthly Resampler
df_plot = df_output_suews.copy()
df_plot.index = df_plot.index.set_names('Month')
rsmp_1M = df_plot \
    .shift(-1) \
    .dropna(how='all') \
    .resample('1M', kind='period')
# mean values
df_1M_mean = rsmp_1M.mean()
# sum values
df_1M_sum = rsmp_1M.sum()
```

```
[39]: # month names
name_mon = [x.strftime('%b') for x in rsmp_1M.groups]
# create subplots showing two panels together
fig, axes = plt.subplots(2, 1, sharex=True)
# surface energy balance
_=df_1M_mean \
    .loc[:, ['QN', 'QS', 'QE', 'QH', 'QF']] \
    .rename(columns=dict_var_disp) \
    .plot(
        ax=axes[0], # specify the axis for plotting
        figsize=(10, 6), # specify figure size

1.4.4 More explorations into simulation results

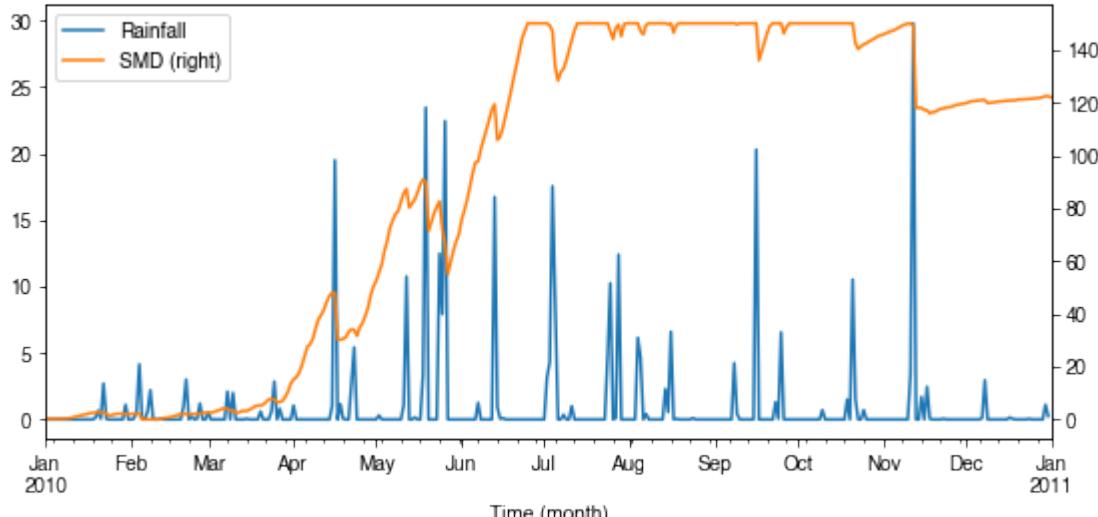

In this section, we will use the simulation results to explore more features revealed by SuPy/SUEWS simulations but *unavailable in your simple model*.

Dynamics in rainfall and soil moisture deficit (SMD)

```
[42]: df_dailystate = df_output.loc[grid, 'DailyState'].dropna(
    how='all').resample('1d').mean()
```

```
[43]: # daily rainfall
ser_p = df_dailystate.P_day.rename('Rainfall')
ser_smd = df_output_suews.SMD
ser_smd_dmax = ser_smd.resample('1d').max().rename('SMD')

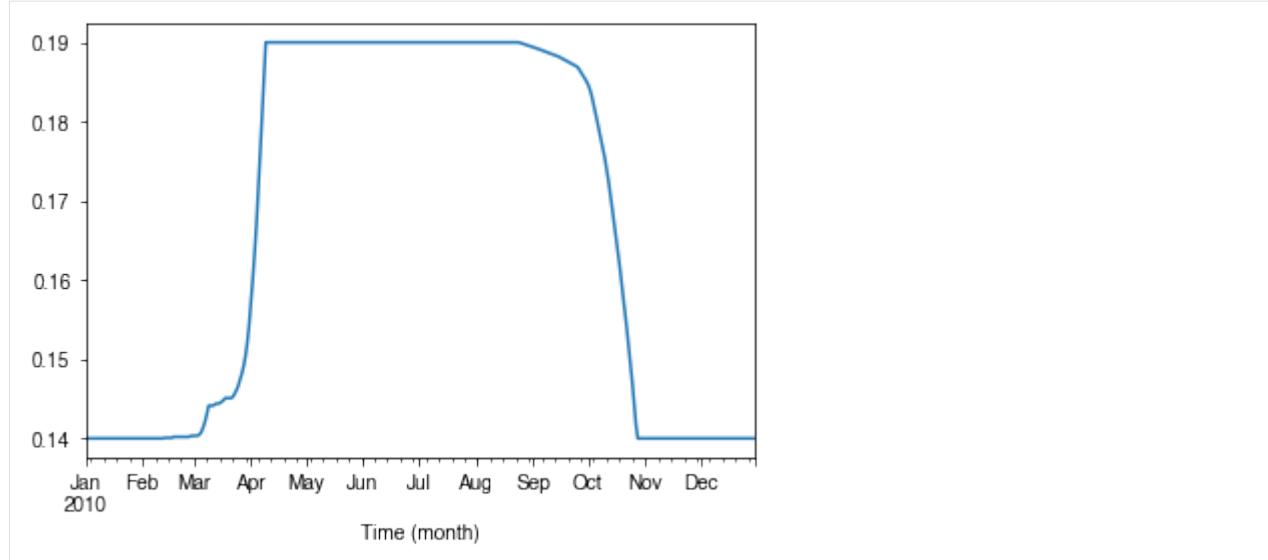

ax = pd.concat([ser_p, ser_smd_dmax], axis=1).plot(secondary_y='SMD',
                                                figsize=(9, 4))
_ = ax.set_xlabel('Time (month)')
```

Variability in albedo

How does albedo change over time?

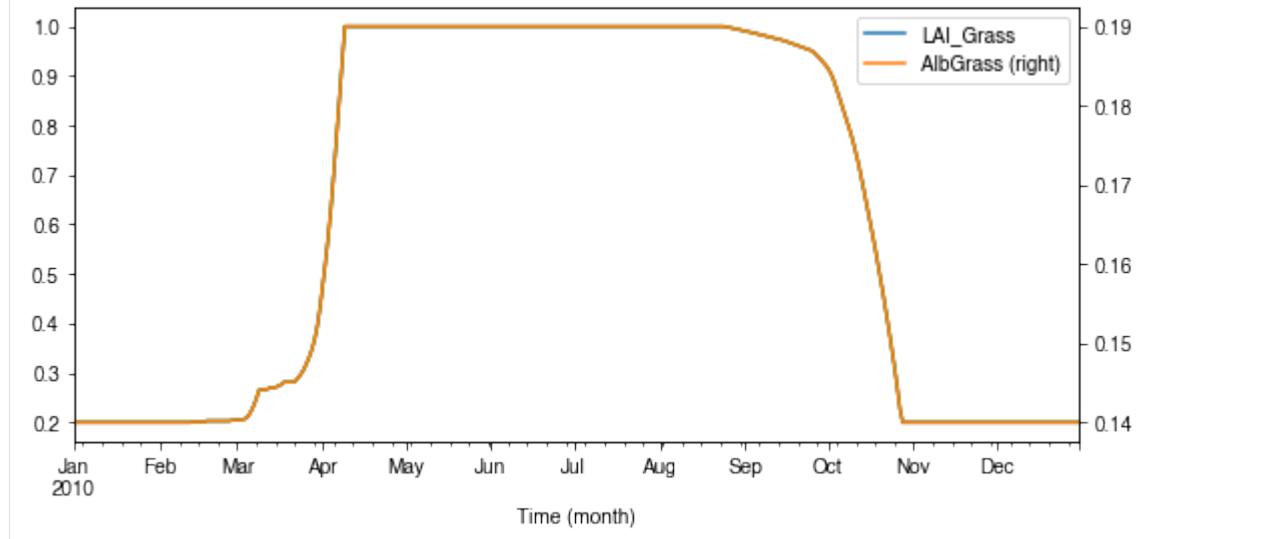

```
[44]: ser_alb = df_dailystate.AlbGrass
ax = ser_alb.plot()
_ = ax.set_xlabel('Time (month)')
```

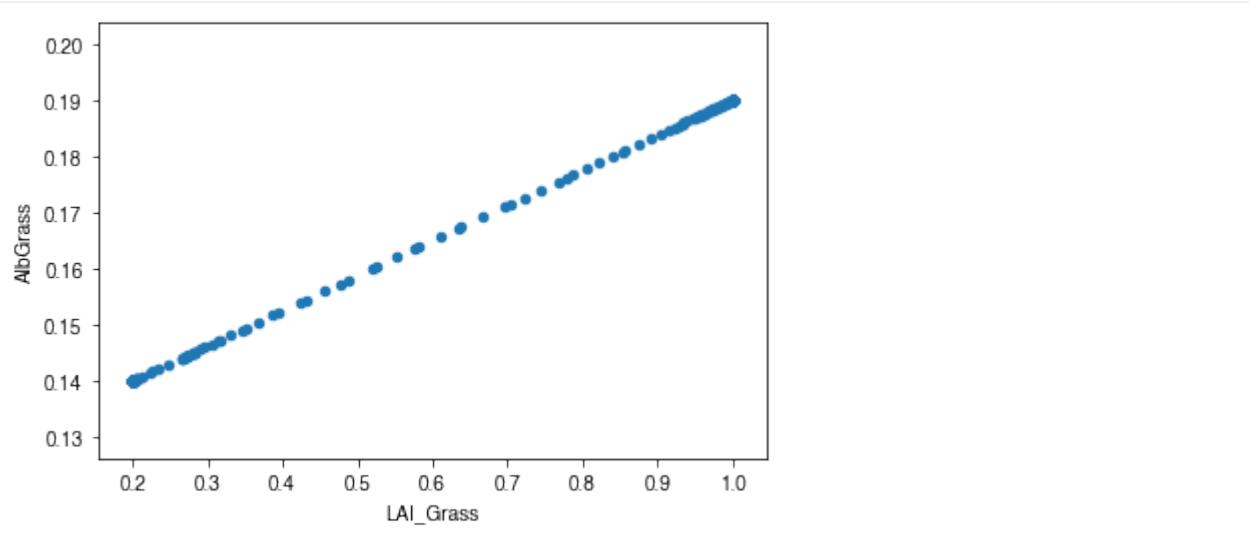

How is albedo associated with vegetation phenology?

```
[45]: ser_lai = df_dailystate.LAI_Grass
pd.concat([ser_lai, ser_alb], axis=1).plot(secondary_y='AlbGrass',
                                             figsize=(9, 4))
ax = ser_lai.plot()
_ = ax.set_xlabel('Time (month)')
```

[45]: <matplotlib.axes._subplots.AxesSubplot at 0x7fc9989c9ac8>

```
[46]: ax_alb_lai = df_dailystate[['LAI_Grass', 'AlbGrass']].plot.scatter(
    x='LAI_Grass',
    y='AlbGrass',
)
ax_alb_lai.set_aspect('auto')
```

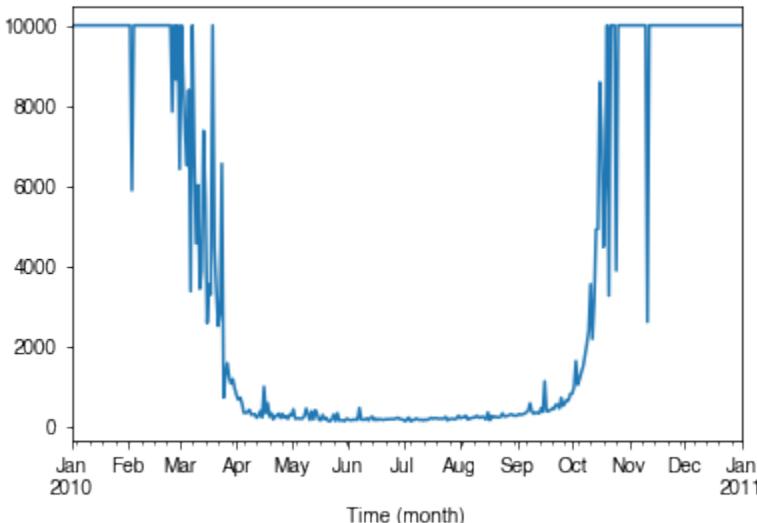

Variability in surface resistance

How does surface resistance vary over time?

```
[47]: ser_rs = df_output_suews.RS
```

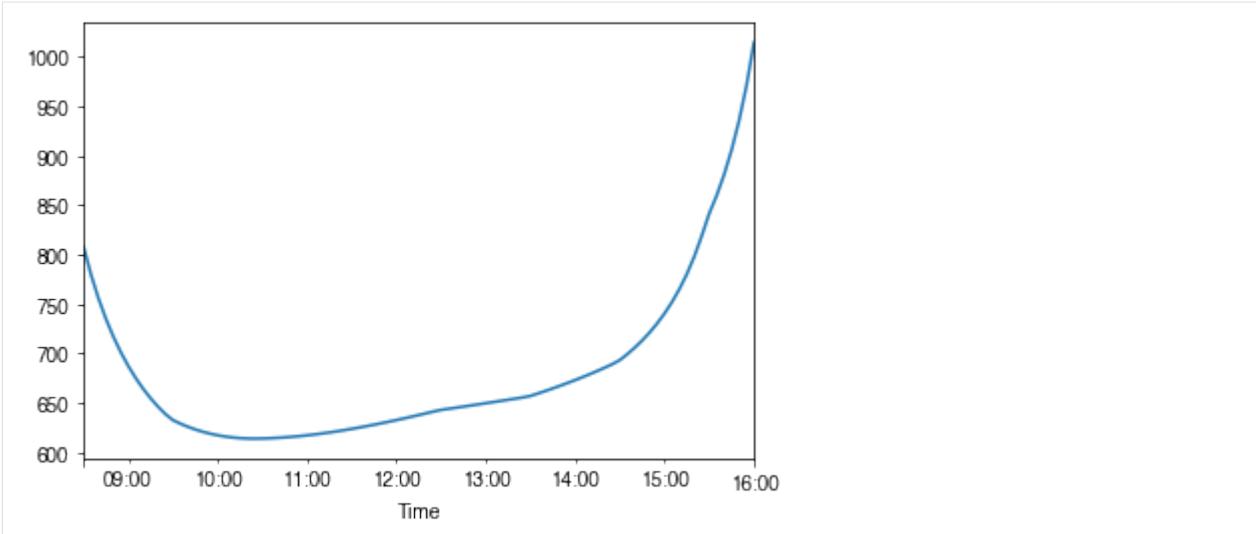

- intra-annual

```
[48]: ax = ser_rs.resample('1d').median().plot()
_ = ax.set_xlabel('Time (month)')
```

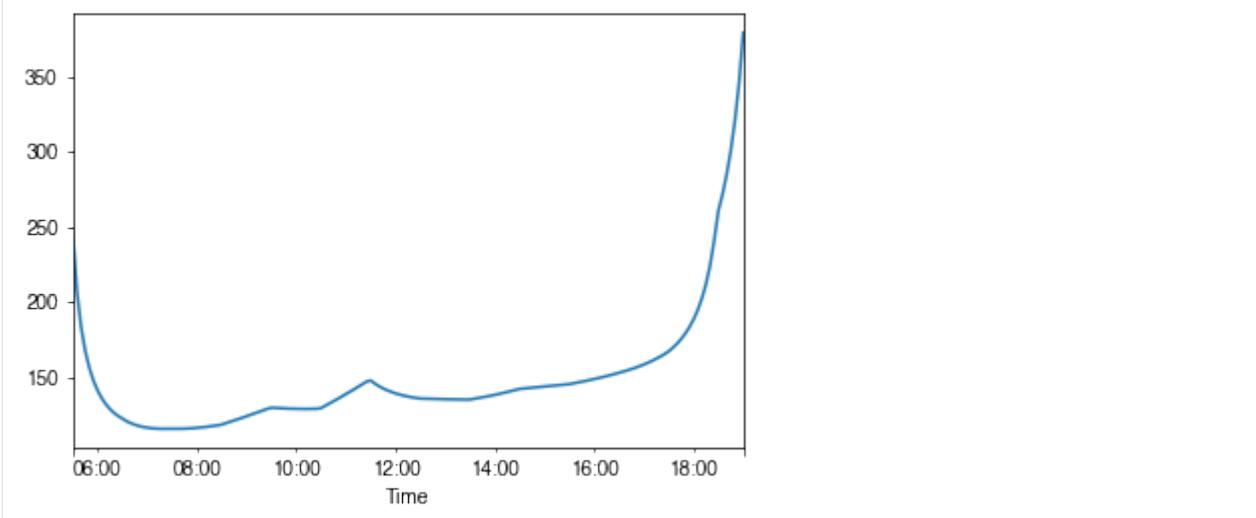

- intra-daily

```
[49]: # a winter day
ax = ser_rs.loc['2010-01-22'].between_time('0830', '1600').plot()
_ = ax.set_xlabel('Time')
```

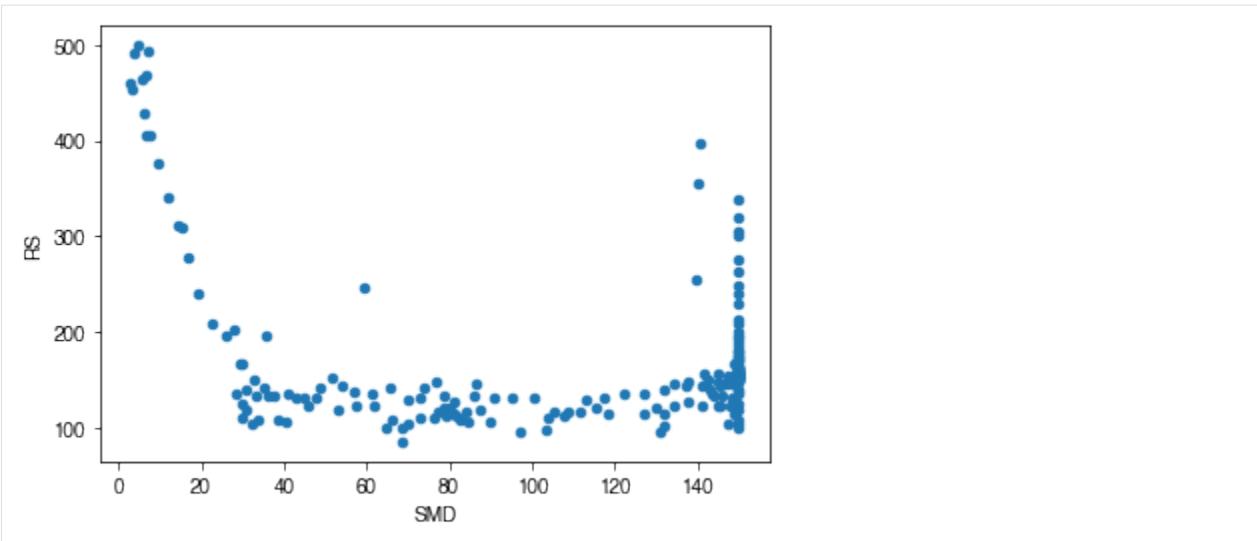

```
[50]: # a summer day
ax = ser_rs.loc['2010-07-01'].between_time('0530', '1900').plot()
_ = ax.set_xlabel('Time')
```

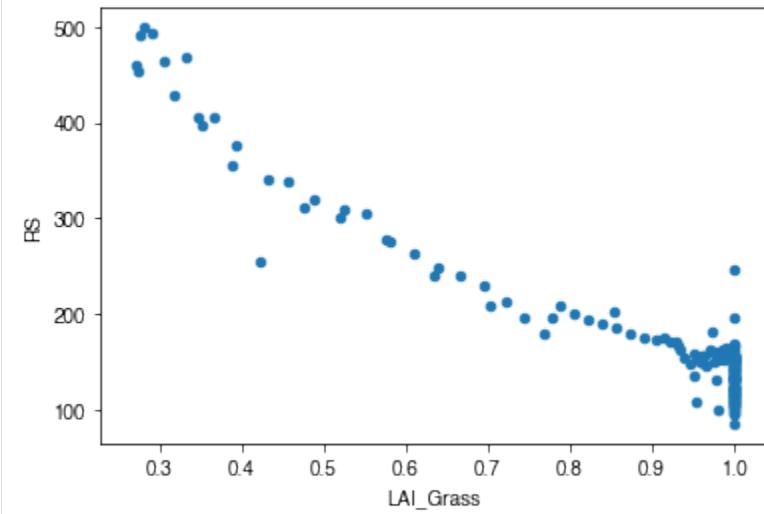

How is surface resistance associated with other surface properties?

```
[51]: # SMD
ser_smd = df_output_suews.SMD
df_x = pd.concat([ser_smd, ser_rs],
                  axis=1).between_time('1000', '1600').resample('1d').mean()
df_x = df_x.loc[df_x.RS < 500]
_ = df_x.plot.scatter(
    x='SMD',
    y='RS',
)
```

```
[52]: # LAI
df_x = pd.concat(
    [ser_lai,
     ser_rs.between_time('1000', '1600').resample('1d').mean()],
    axis=1)
df_x = df_x.loc[df_x.RS < 500]
_ = df_x.plot.scatter(
    x='LAI_Grass',
    y='RS',
)
```

How is surface resistance dependent on meteorological conditions?

```
[53]: cmap_sel = plt.cm.get_cmap('RdBu', 12)
```

```
[54]: # solar radiation
# colour by season
```

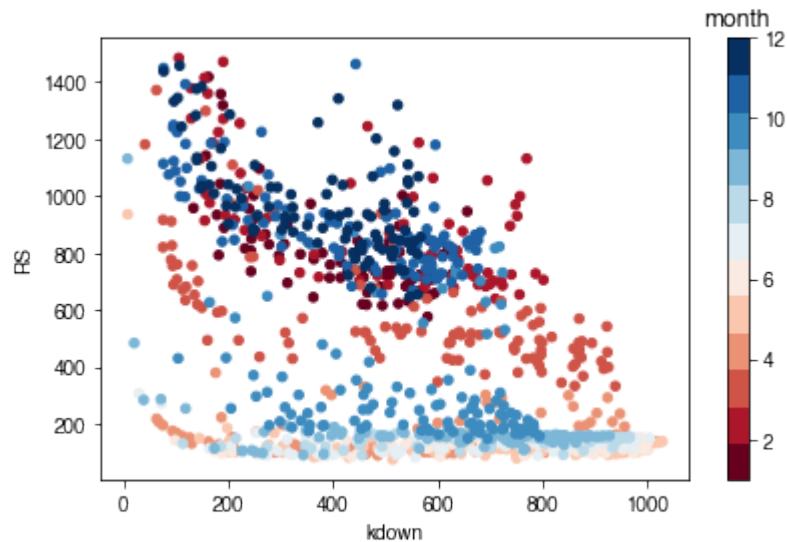

(continues on next page)

(continued from previous page)

```

ser_kdown = df_forcing_amf.kdown
df_x = pd.concat([ser_kdown, ser_rs], axis=1).between_time('1000', '1600')
df_x = df_x.loc[df_x.RS < 1500]
df_plot = df_x.iloc[::20]
ax = df_plot.plot.scatter(x='kdown',
                           y='RS',

                           cmap=cmap_sel,
                           sharex=False)
fig = ax.figure
_ = fig.axes[1].set_title('month')
fig.tight_layout()

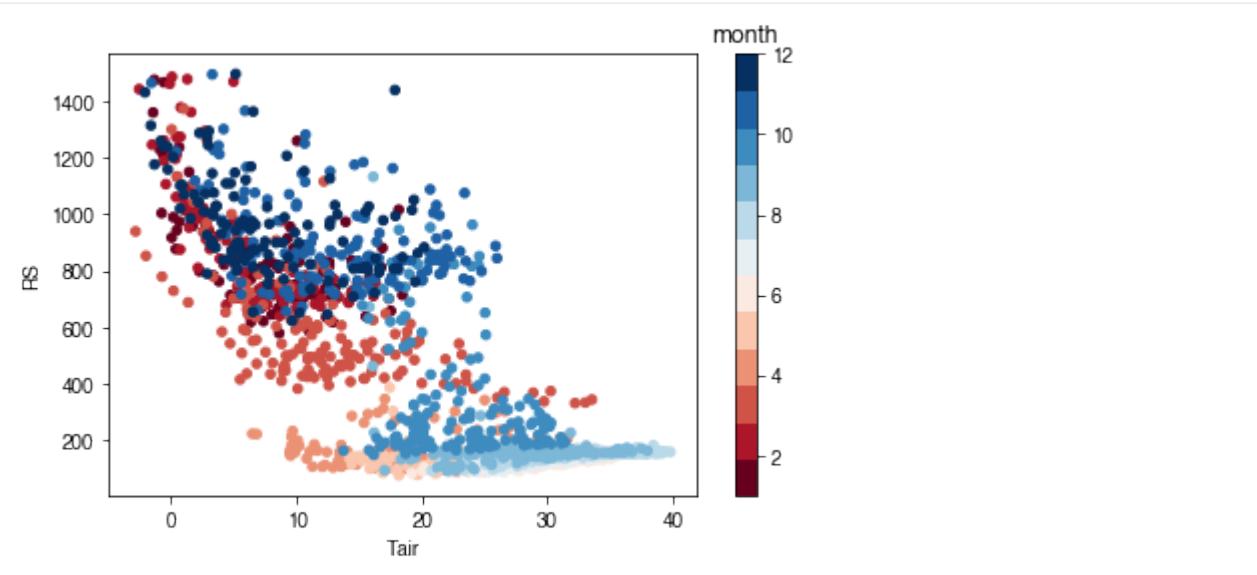

```

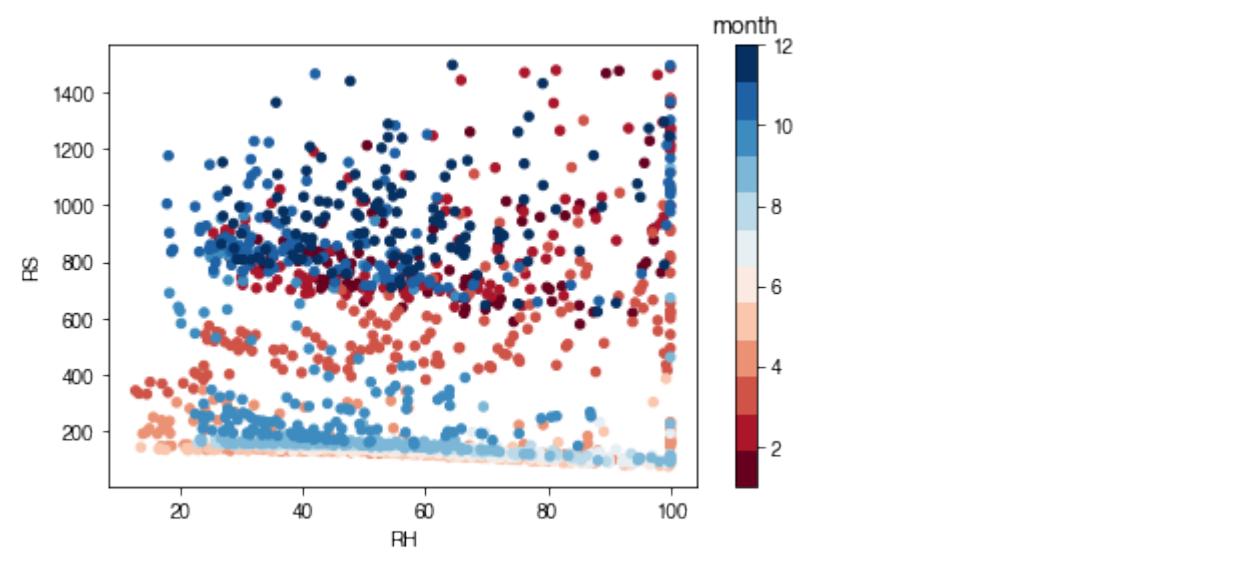

```
[56]: # air humidity
ser_rh = df_forcing_amf.RH
df_x = pd.concat([ser_rh, ser_rs], axis=1).between_time('1000', '1600')
df_x = df_x.loc[df_x.RS < 1500]
df_plot = df_x.iloc[::15]
ax = df_plot.plot.scatter(x='RH',
                           y='RS',
                           c=df_plot.index.month,
                           cmap=cmap_sel,
                           sharex=False)
fig = ax.figure
_ = fig.axes[1].set_title('month')
fig.tight_layout()
```

- Task:

Based on the above plots showing RS vs. met. conditions, explore these relationships again at the intra-daily scales.

End of doc/tutorial/AMF-sim.ipynb

Note:

1. The Anaconda distribution is suggested as the scientific Python 3 environment for its completeness in necessary packages. Please follow the official guide for its [installation](#).
 2. Users with less experience in Python are suggested to go through the following section first before using SuPy.
-

1.5 Python 101 before SuPy

Admittedly, this header is somewhat misleading: given the enormity of Python, it's more challenging to get this section *correct* than coding SuPy per se. As such, here a collection of data analysis oriented links to useful Python resources is provided to help novices start using Python and **then** SuPy.

- [The gist of Python](#): a quick introductory blog that covers Python basics for data analysis.
- Jupyter Notebook: Jupyter Notebook provides a powerful notebook-based data analysis environment that SuPy users are strongly encouraged to use. Jupyter notebooks can run in browsers (desktop, mobile) either by easy local configuration or on remote servers with pre-set environments (e.g., [Google Colaboratory](#), [Microsoft Azure Notebooks](#)). In addition, Jupyter notebooks allow great shareability by incorporating source code and detailed notes in one place, which helps users to organise their computation work.
 - Installation
Jupyter notebooks can be installed with pip on any desktop/server system and open .ipynb notebook files locally:

```
python3 -m pip install jupyter -U
```
 - Extensions: To empower your Jupyter Notebook environment with better productivity, please check out the [Unofficial Jupyter Notebook Extensions](#). Quick introductory blogs can be found [here](#) and [here](#).
- pandas: `pandas` is heavily used in SuPy and thus better understanding of pandas is essential in SuPy workflows.
 - Introductory blogs:
 - * [Quick dive into Pandas for Data Science](#): introduction to pandas.
 - * [Basic Time Series Manipulation with Pandas](#): pandas-based time series manipulation.
 - * [Introduction to Data Visualization in Python](#): plotting using pandas and related libraries.
 - A detailed tutorial in Jupyter Notebooks:
 - * [Introduction to pandas](#)
 - * [pandas fundamentals](#)
 - * [Data Wrangling with pandas](#)

The following section was generated from docs/source/data-structure/supy-io.ipynb

CHAPTER 2

Key IO Data Structures in SuPy

2.1 Introduction

The cell below demonstrates a minimal case of SuPy simulation with all key IO data structures included:

```
[1]: import supy as sp
df_state_init, df_forcing = sp.load_SampleData()
df_output, df_state_final = sp.run_supy(df_forcing, df_state_init)
```

- Input: SuPy requires two DataFrames to perform a simulation, which are:
 - `df_state_init`: model initial states;
 - `df_forcing`: forcing data.

These input data can be loaded either through calling `load_SampleData()` as shown above or using `init_supy`. Or, based on the loaded sample DataFrames, you can modify the content to create new DataFrames for your specific needs.

- Output: The output data by SuPy consists of two DataFrames:
 - `df_output`: model output results; this is usually the basis for scientific analysis.
 - `df_state_final`: model final states; any of its entries can be used as a `df_state_init` to start another SuPy simulation.

2.2 Input

2.2.1 `df_state_init`: model initial states

```
[2]: df_state_init.head()
```

```

```

`df_state_init` is organised with ***grids*** in **rows** and ***their states*** in **columns**. The details of all state variables can be found in [the description page](#).

Please note the properties are stored as *flattened values* to fit into the tabular format due to the nature of `DataFrame` though they may actually be of higher dimension (e.g. `ahprof_24hr` with the dimension {24, 2}). To indicate the variable dimensionality of these properties, SuPy use the `ind_dim` level in columns for indices of values:

- 0 for scalars;
- (`ind_dim1`, `ind_dim2`, ...) for arrays (for a generic sense, vectors are 1D arrays).

Take `ohm_coef` below for example, it has a dimension of {8, 4, 3} according to [the description](#), which implies the actual values used by SuPy in simulations are passed in a layout as an array of the dimension {8, 4, 3}. As such, to get proper values passed in, users should follow the dimensionality requirement to prepare/modify `df_state_init`.

```
[3]: df_state_init.loc[:, 'ohm_coef']

[3]: ind_dim  (0, 0, 0)  (0, 0, 1)  (0, 0, 2)  (0, 1, 0)  (0, 1, 1)  (0, 1, 2)  \

Note:

The index of df_forcing **SHOULD BE** strictly of DatetimeIndex type if you want create a df_forcing for SuPy simulation. The SuPy runtime time-step size is instructed by the df_forcing with its index information.

The infomation below indicates SuPy will run at a 5 min (i.e. 300 s) time-step if driven by this specific df_forcing:

[5] : freq_forcing=df_forcing.index.freq
freq_forcing

[5]: <300 * Seconds>

2.3 Output

2.3.1 df_output: model output results

df_output is organised with ***temporal records of grids*** in **rows** and ***output variables of different groups*** in **columns**. The details of all forcing variables can be found in [the description page](#).

```

`df_output` are recorded at the same temporal resolution as `df_forcing`:

```
[7]: freq_out = df_output.index.levels[1].freq
(freq_out, freq_out == freq_forcing)

[7]: (<300 * Seconds>, True)
```

2.3.2 `df_state_final`: model final states

`df_state_final` has the identical data structure as `df_state_init` except for the extra level `datetime` in index, which stores the temporal information associated with model states. Such structure can facilitate the reuse of it as initial model states for other simulations (e.g., diagnostics of runtime model states with `save_state=True` set in `run_supy`; or simply using it as the initial conditions for future simulations starting at the ending times of previous runs).

The meanings of state variables in `df_state_final` can be found in [the description page](#).

```

CHAPTER 3

API reference

3.1 Top-level Functions

<code>init_supy(path_init[, force_reload, check_input])</code>	Initialise supy by loading initial model states.
<code>load_forcing_grid(path_runcontrol, grid[, ...])</code>	Load forcing data for a specific grid included in the index of <code>df_state_init</code> .
<code>run_supy(df_forcing, df_state_init[, ...])</code>	Perform supy simulation.
<code>save_supy(df_output, df_state_final, freq_s, ...)</code>	Save SuPy run results to files
<code>load_SampleData()</code>	Load sample data for quickly starting a demo run.
<code>show_version()</code>	print <code>SuPy</code> and <code>supy_driver</code> version information.

3.1.1 `supy.init_supy`

`supy.init_supy(path_init: str, force_reload=True, check_input=False) → pandas.core.frame.DataFrame`
Initialise supy by loading initial model states.

Parameters

- **`path_init (str)`** –

Path to a file that can initialise SuPy, which can be either of the follows:

- SUEWS `RunControl.nml`: a namelist file for SUEWS configurations
- SuPy `df_state.csv`: a CSV file including model states produced by a SuPy run via `supy.save_supy()`

- **`force_reload (boolean, optional)`** – Flag to force reload all initialisation files by clearing all cached states, with default value `True` (i.e., force reload all files). Note: If the number of simulation grids is large (e.g., > 100), `force_reload=False` is strongly recommended for better performance.

Returns `df_state_init` – Initial model states. See `df_state variables` for details.

Return type `pandas.DataFrame`

Examples

1. Use `RunControl.nml` to initialise SuPy

```
>>> path_init = "~/SUEWS_sims/RunControl.nml"
>>> df_state_init = supy.init_supy(path_init)
```

2. Use `df_state.csv` to initialise SuPy

```
>>> path_init = "~/SuPy_res/df_state_test.csv"
>>> df_state_init = supy.init_supy(path_init)
```

3.1.2 `supy.load_forcing_grid`

`supy.load_forcing_grid(path_runcontrol: str, grid: int, check_input=False) → pandas.core.frame.DataFrame`
Load forcing data for a specific grid included in the index of `df_state_init`.

Parameters

- `path_runcontrol (str)` – Path to SUEWS `RunControl.nml`
- `grid (int)` – Grid number

Returns `df_forcing` – Forcing data. See [df_forcing variables](#) for details.

Return type `pandas.DataFrame`

Examples

```
>>> path_runcontrol = "~/SUEWS_sims/RunControl.nml" # a valid path to `RunControl.nml`
>>> df_state_init = supy.init_supy(path_runcontrol) # get `df_state_init`
>>> grid = df_state_init.index[0] # first grid number included in `df_state_init`
>>> df_forcing = supy.load_forcing_grid(path_runcontrol, grid) # get df_forcing
```

3.1.3 `supy.run_supy`

`supy.run_supy(df_forcing: pandas.core.frame.DataFrame, df_state_init: pandas.core.frame.DataFrame, save_state=False, chunk_day=3660, logging_level=20, check_input=False, serial_mode=False) → Tuple[pandas.core.frame.DataFrame, pandas.core.frame.DataFrame]`
Perform supy simulation.

Parameters

- `df_forcing (pandas.DataFrame)` – forcing data for all grids in `df_state_init`.
- `df_state_init (pandas.DataFrame)` – initial model states; or a collection of model states with multiple timestamps, whose last temporal record will be used as the initial model states.
- `save_state (bool, optional)` – flag for saving model states at each time step, which can be useful in diagnosing model runtime performance or performing a restart run. (the default is False, which instructs supy not to save runtime model states).

- **chunk_day** (*int, optional*) – chunk size (chunk_day days) to split simulation periods so memory usage can be reduced. (the default is 3660, which implies ~10-year forcing chunks used in simulations).
- **logging_level** (*logging level*) – one of these values [50 (CRITICAL), 40 (ERROR), 30 (WARNING), 20 (INFO), 10 (DEBUG)]. A lower value informs SuPy for more verbose logging info.
- **check_input** (*bool, optional*) – flag for checking validity of input: df_forcing and df_state_init. If set to `True`, any detected invalid input will stop SuPy simulation; a `False` flag will bypass such validation and may incur kernel error if any invalid input. *Note: such checking procedure may take some time if the input is large.* (the default is `False`, which bypasses the validation).
- **serial_mode** (*bool, optional*) – If set to `True`, SuPy simulation will be conducted in serial mode; a `False` flag will try parallel simulation if possible (Windows not supported, i.e., always serial). (the default is `False`).

Returns**df_output, df_state_final –**

- `df_output`: *output results*
- `df_state_final`: *final model states*

Return type Tuple[pandas.DataFrame, pandas.DataFrame]**Examples**

```
>>> df_output, df_state_final = supy.run_supy(df_forcing, df_state_init)
```

3.1.4 supy.save_supy

```
supy.save_supy(df_output: pandas.core.frame.DataFrame, df_state_final: pandas.core.frame.DataFrame, freq_s: int = 3600, site: str = "", path_dir_save: str = PosixPath('.'), path_runcontrol: str = None, save_tstep=False, logging_level=50, output_level=1, debug=False) → list
```

Save SuPy run results to files

Parameters

- **df_output** (*pandas.DataFrame*) – DataFrame of output
- **df_state_final** (*pandas.DataFrame*) – DataFrame of final model states
- **freq_s** (*int, optional*) – Output frequency in seconds (the default is 3600, which indicates hourly output)
- **site** (*str, optional*) – Site identifier (the default is ‘’, which indicates site identifier will be left empty)
- **path_dir_save** (*str, optional*) – Path to directory to saving the files (the default is `Path('')`, which indicates the current working directory)
- **path_runcontrol** (*str, optional*) – Path to SUEWS `RunControl.nml`, which, if set, will be preferably used to derive `freq_s`, `site` and `path_dir_save`. (the default is `None`, which is unset)

- **save_tstep** (*bool, optional*) – whether to save results in temporal resolution as in simulation (which may result very large files and slow progress), by default False.
- **logging_level** (*logging level*) – one of these values [50 (CRITICAL), 40 (ERROR), 30 (WARNING), 20 (INFO), 10 (DEBUG)]. A lower value informs SuPy for more verbose logging info.
- **output_level** (*integer, optional*) – option to determine selection of output variables, by default 1. Notes: 0 for all but snow-related; 1 for all; 2 for a minimal set without land cover specific information.
- **debug** (*bool, optional*) – whether to enable debug mode (e.g., writing out in serial mode, and other debug uses), by default False.

Returns a list of paths of saved files

Return type list

Examples

1. save results of a supy run to the current working directory with default settings

```
>>> list_path_save = supy.save_supy(df_output, df_state_final)
```

2. save results according to settings in RunControl.nml

```
>>> list_path_save = supy.save_supy(df_output, df_state_final, path_runcontrol=
    ↪'path/to/RunControl.nml')
```

3. save results of a supy run at resampling frequency of 1800 s (i.e., half-hourly results) under the site code Test to a customised location ‘path/to/some/dir’

```
>>> list_path_save = supy.save_supy(df_output, df_state_final, freq_s=1800, site=
    ↪'Test', path_dir_save='path/to/some/dir')
```

3.1.5 supy.load_SampleData

`supy.load_SampleData()` → Tuple[pandas.core.frame.DataFrame, pandas.core.frame.DataFrame]
Load sample data for quickly starting a demo run.

Returns

df_state_init, df_forcing –

- df_state_init: *initial model states*
- df_forcing: *forcing data*

Return type Tuple[pandas.DataFrame, pandas.DataFrame]

Examples

```
>>> df_state_init, df_forcing = supy.load_SampleData()
```

3.1.6 supy.show_version

```
supy.show_version()
    print SuPy and supy_driver version information.
```

3.2 Utility Functions

3.2.1 ERA-5 Data Downloader

<code>download_era5(lat_x, lon_x, start, end[, ...])</code>	Generate ERA-5 cdsapi-based requests and download data for area of interests.
<code>gen_forcing_era5(lat_x, lon_x, start, end[, ...])</code>	Generate SUEWS forcing files using ERA-5 data.

supy.util.download_era5

```
supy.util.download_era5(lat_x: float, lon_x: float, start: str, end: str, dir_save=PosixPath('.'), grid=[0.125, 0.125], scale=0) → dict
Generate ERA-5 cdsapi-based requests and download data for area of interests.
```

Parameters

- **lat_x** (`float`) – Latitude of centre at the area of interest.
- **lon_x** (`float`) – Longitude of centre at the area of interest.
- **start** (`str`) – Any datetime-like string that can be parsed by `pandas.daterange()`.
- **end** (`str`) – Any datetime-like string that can be parsed by `pandas.daterange()`.
- **grid** (`list, optional`) – grid size used in CDS request API, by default [0.125, 0.125].
- **scale** (`int, optional`) – scaling factor that determines the area of interest (i.e., `area=grid[0]*scale`), by default 0.
- **dir_save** (`Path or path-like string`) – path to directory for saving downloaded ERA5 netCDF files.

Returns key: name of downloaded file. value: CDS API request used for downloading the file named by the corresponding key.

Return type `dict`

Note: This function uses CDS API to download ERA5 data; follow this for configuration first: <https://cds.climate.copernicus.eu/api-how-to>

supy.util.gen_forcing_era5

```
supy.util.gen_forcing_era5(lat_x: float, lon_x: float, start: str, end: str, dir_save=PosixPath('.'), grid=[0.125, 0.125], hgt_agl_diag=100.0, scale=0, sim_ple_mode=True) → list
Generate SUEWS forcing files using ERA-5 data.
```

Parameters

- **lat_x** (`float`) – Latitude of centre at the area of interest.

- **lon_x** (`float`) – Longitude of centre at the area of interest.
- **start** (`str`) – Any datetime-like string that can be parsed by `pandas.daterange()`.
- **end** (`str`) – Any datetime-like string that can be parsed by `pandas.daterange()`.
- **dir_save** (*Path or path-like string*) – path to directory for saving downloaded ERA5 netCDF files.
- **grid** (`list, optional`) – grid size used in CDS request API, by default [0.125, 0.125].
- **hgt_agl_diag** (`float`) – height above ground level to diagnose forcing variables, by default 0; the ground level is taken from ERA5 grid altitude.
- **scale** (`int, optional`) – scaling factor that determines the area of interest (i.e., `area=grid[0]*scale`), by default 0
- **simple_mode** (`boolean`) – if use the *simple* mode for diagnosing the forcing variables, by default `True`. In the simple mode, temperature is diagnosed using environmental lapse rate 6.5 K/km and wind speed using MOST under neutral condition. If `False`, MOST with consideration of stability conditions will be used to diagnose forcing variables.

Returns A list of files in SUEWS forcing input format.

Return type List

Note:

1. This function uses CDS API to download ERA5 data; follow this for configuration first: <https://cds.climate.copernicus.eu/api-how-to>
2. The generated forcing files can be imported using `supy.util.read_forcing` to get simulation-ready ‘`pandas.DataFrame`’s.
3. See Section 3.10.2 and 3.10.3 in the reference for details of diagnostics calculation.

ECMWF, S. P. (2016). In IFS documentation CY41R2 Part IV: Physical Processes. ECMWF: Reading, UK, 111-113. <https://www.ecmwf.int/en/elibrary/16648-part-iv-physical-processes>

3.2.2 Typical Meteorological Year

<code>gen_epw(df_output[, path_epw, ratio_dif_dir])</code>	Generate an <code>epw</code> file of uTMY (urbanised Typical Meteorological Year) using SUEWS simulation results
<code>read_epw(path_epw)</code>	Read in <code>epw</code> file as a DataFrame

`supy.util.gen_epw`

`supy.util.gen_epw(df_output: pandas.core.frame.DataFrame, path_epw=PosixPath('TMY.epw'), ratio_dif_dir=0.15) → Tuple[pandas.core.frame.DataFrame, str, pathlib.Path]`
Generate an `epw` file of uTMY (urbanised Typical Meteorological Year) using SUEWS simulation results

Parameters

- **df_output** (`pd.DataFrame`) – SUEWS simulation results.
- **path_epw** (*Path, optional*) – Path to store generated `epw` file, by default `Path('./uTMY.epw')`

- **ratio_dif_dir** (*float*, *optional*) – Ratio between direct and diffuse solar radiation, by default 0.15

Returns**df_epw, text_meta, path_epw –**

- df_epw: uTMY result
- text_meta: meta-info text
- path_epw: path to generated epw file

Return type Tuple[pd.DataFrame, str, Path]**supy.util.read_epw**supy.util.read_epw(*path_epw: pathlib.Path*) → pandas.core.frame.DataFrame

Read in epw file as a DataFrame

Parameters **path_epw** (*Path*) – path to epw file**Returns** **df_tmy** – TMY results of epw file**Return type** pd.DataFrame

3.2.3 Gap Filling

fill_gap_all(*ser_to_fill[, freq]*)Fill all gaps in a time series using data from neighbouring divisions of ‘freq’

supy.util.fill_gap_allsupy.util.fill_gap_all(*ser_to_fill: pandas.core.series.Series, freq='1D'*) → pandas.core.series.Series

Fill all gaps in a time series using data from neighbouring divisions of ‘freq’

Parameters

- **ser_to_fill** (*pd.Series*) – Time series to gap-fill
- **freq** (*str*, *optional*) – Frequency to identify gapped divisions, by default ‘1D’

Returns

- **ser_test_filled** (*pd.Series*) – Gap-filled time series.
- *Patterns*
- _____
- **010** (*missing data in division between others with no missing data*)
- **01** (*missing data in division after one with no missing data*)
- **10** (*division with missing data before one with no missing data*)

3.2.4 OHM

<code>derive_ohm_coef(ser_QS, ser_QN)</code>	A function to linearly fit two independant variables to a dependent one.
<code>sim_ohm(ser_qn, a1, a2, a3)</code>	Calculate QS using OHM (Objective Hysteresis Model).

supy.util.derive_ohm_coef

`supy.util.derive_ohm_coef(ser_QS, ser_QN)`

A function to linearly fit two independant variables to a dependent one. Input params: QS_Ser: The dependent variable QS (Surface heat storage). Pandas Series.

QN_Ser: The first independent variable (Net all wave radiation). Pandas Series. dt: The time interval with which the rate of change of QN is calculated. Float (hours).

Returns: a1, a2 coefficients and a3 (intercept)

supy.util.sim_ohm

`supy.util.sim_ohm(ser_qn: pandas.core.series.Series, a1: float, a2: float, a3: float) → pandas.core.series.Series`
Calculate QS using OHM (Objective Hysteresis Model).

Parameters

- **ser_qn** (`pd.Series`) – net all-wave radiation.
- **a1** (`float`) – a1 of OHM coefficients.
- **a2** (`float`) – a2 of OHM coefficients.
- **a3** (`float`) – a3 of OHM coefficients.

Returns heat storage flux calculated by OHM.

Return type `pd.Series`

3.2.5 Surface Conductance

<code>cal_gs_mod(kd, ta_k, rh, pa, smd, lai, g_cst)</code>	Model surface conductance/resistance using phenology and atmospheric forcing conditions.
<code>cal_gs_obs(qh, qe, ta, rh, pa)</code>	Calculate surface conductance based on observations, notably turbulent fluxes.
<code>calib_g(df_fc_suews[, g_max, lai_max, s1, ...])</code>	Calibrate parameters for modelling surface conductance over vegetated surfaces using LMFIT.

supy.util.cal_gs_mod

`supy.util.cal_gs_mod(kd, ta_k, rh, pa, smd, lai, g_cst, g_max=30.0, lai_max=6.0, s1=5.56)`

Model surface conductance/resistance using phenology and atmospheric forcing conditions.

Parameters

- **kd** (`numeric`) – Incoming solar radiation [W m-2]
- **ta_k** (`numeric`) – Air temperature [K]
- **rh** (`numeric`) – Relative humidity [%]

- **pa** (*numeric*) – Air pressure
- **smd** (*numeric*) – Soil moisture deficit [mm]
- **lai** (*numeric*) – Leaf area index [m² m⁻²]
- **g_cst** (*size-6 array*) – Parameters to determine surface conductance/resistance: g1 (LAI related), g2 (solar radiation related), g3 (humidity related), g4 (humidity related), g5 (air temperature related), g6 (soil moisture related)
- **g_max** (*numeric, optional*) – Maximum surface conductance [mm s⁻¹], by default 30
- **lai_max** (*numeric, optional*) – Maximum LAI [m² m⁻²], by default 6
- **s1** (*numeric, optional*) – Wilting point (WP=s1/g6, indicated as deficit [mm]) related parameter, by default 5.56

Returns Modelled surface conductance [mm s⁻¹]

Return type numeric

supy.util.cal_gs_obs

`supy.util.cal_gs_obs(qh, qe, ta, rh, pa)`

Calculate surface conductance based on observations, notably turbulent fluxes.

Parameters

- **qh** (*numeric*) – Sensible heat flux [W m⁻²]
- **qe** (*numeric*) – Latent heat flux [W m⁻²]
- **ta** (*numeric*) – Air temperature [K]
- **rh** (*numeric*) – Relative humidity [%]
- **pa** (*numeric*) – Air pressure [Pa]

Returns Surface conductance based on observations [mm s⁻¹]

Return type numeric

supy.util.calib_g

`supy.util.calib_g(df_fc_suews, g_max=33.1, lai_max=5.9, s1=5.56, method='cobyyla', prms_init=None, debug=False)`

Calibrate parameters for modelling surface conductance over vegetated surfaces using LMFIT.

Parameters

- **df_fc_suews** (`pandas.DataFrame`) – DataFrame in SuPy forcing format
- **g_max** (*numeric, optional*) – Maximum surface conductance [mm s⁻¹], by default 30
- **lai_max** (*numeric, optional*) – Maximum LAI [m² m⁻²], by default 6
- **s1** (*numeric, optional*) – Wilting point (WP=s1/g6, indicated as deficit [mm]) related parameter, by default 5.56
- **method** (*str, optional*) – Method used in minimisation by `lmfit.minimize`: details refer to its method.

- **prms_init** (*lmfit.Parameters*) – Initial parameters for calibration
- **debug** (*bool, optional*) – Option to output final calibrated ModelResult, by default False

Returns**dict, or ‘ModelResult <lmfit –**

1. dict: {parameter_name -> best_fit_value}
2. ModelResult

Note: Parameters for surface conductance: g1 (LAI related), g2 (solar radiation related), g3 (humidity related), g4 (humidity related), g5 (air temperature related), g6 (soil moisture related)

Return type ModelResult>‘ if debug==True

Note: For calibration validity, turbulent fluxes, QH and QE, in df_fc_suews should ONLY be observations, i.e., interpolated values should be avoided. To do so, please place np.nan as missing values for QH and QE.

3.2.6 WRF-SUEWS

<code>extract_reclassification(path_nml)</code>	Extract reclassification info from path_nml as a DataFrame.
<code>plot_reclassification(path_nml[, path_save, ...])</code>	Produce Sankey Diagram to visualise the reclassification specified in path_nml

supy.util.extract_reclassification

```
supy.util.extract_reclassification(path_nml: str) → pandas.core.frame.DataFrame  
Extract reclassification info from path_nml as a DataFrame.
```

Parameters **path_nml** (*str*) – Path to namelist.suews

Returns Reclassification DataFrame with rows for WRF land covers while columns for SUEWS.

Return type pd.DataFrame

supy.util.plot_reclassification

```
supy.util.plot_reclassification(path_nml: str, path_save='LC-WRF-SUEWS.png', width=800,  
height=360, top=10, bottom=10, left=260, right=60)  
Produce Sankey Diagram to visualise the reclassification specified in path_nml
```

Parameters

- **path_nml** (*str*) – Path to namelist.suews
- **path_save** (*str, optional*) – Path to save Sankey diagram, by default ‘LC-WRF-SUEWS.png’
- **width** (*int, optional*) – Width of diagram, by default 800
- **height** (*int, optional*) – Height of diagram, by default 360

- **top** (*int, optional*) – Top margin of diagram, by default 10
- **bottom** (*int, optional*) – Bottom margin of diagram, by default 10
- **left** (*int, optional*) – Left margin of diagram, by default 260
- **right** (*int, optional*) – Right margin of diagram, by default 60

Returns Sankey Diagram showing the reclassification.

Return type Sankey Diagram

3.2.7 Plotting

<code>plot_comp(df_var[, fig, ax])</code>	Produce a scatter plot with linear regression line to compare simulation results and observations.
<code>plot_day_clm(df_var[, fig, ax])</code>	Produce a ensemble diurnal climatologies with uncertainties shown in inter-quartile ranges.

`supy.util.plot_comp`

`supy.util.plot_comp(df_var, fig=None, ax=None)`

Produce a scatter plot with linear regression line to compare simulation results and observations.

Parameters **df_var** (*pd.DataFrame*) – DataFrame containing variables to plot with datetime as index. Two columns, ‘Obs’ and ‘Sim’ for observations and simulation results, respectively, must exist.

Returns figure showing 1:1 line plot

Return type MPL.figure

`supy.util.plot_day_clm`

`supy.util.plot_day_clm(df_var, fig=None, ax=None)`

Produce a ensemble diurnal climatologies with uncertainties shown in inter-quartile ranges.

Parameters **df_var** (*pd.DataFrame*) – DataFrame containing variables to plot with datetime as index

Returns figure showing median lines and IQR in shadings

Return type MPL.figure

3.3 Command-Line Tools

3.3.1 suews-run

Run SUEWS simulation using settings in PATH_RUNCONTROL (default: “./RunControl.nml”, i.e., the RunControl namelist file in the current directory).

<code>suews-run [OPTIONS] [PATH_RUNCONTROL]</code>
--

Arguments

PATH_RUNCONTROL

Optional argument

3.3.2 suews-convert

Convert SUEWS input tables from older versions to newer ones (one-way only).

```
suews-convert [OPTIONS]
```

Options

-f, --from <fromVer>

Version to convert from [required]

Options 2019a|2018c|2018b|2018a|2017a|2016a

-t, --to <toVer>

Version to convert to [required]

Options 2019b|2019a|2018c|2018b|2018a|2017a

-i, --input <fromDir>

Original directory to convert [required]

-o, --output <toDir>

New directory to create for converted tables [required]

3.4 Key Data Structures

3.4.1 df_state variables

Note: Data structure of `df_state` is explained [here](#).

aerodynamicresistancemethod

Description Internal use. Please DO NOT modify

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables None

ah_min

Description Minimum QF values.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables `AHMin_WD`, `AHMin_WE`

ah_slope_cooling

Description Cooling slope of QF calculation.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables AHSlope_Cooling_WD, AHSlope_Cooling_WE

ah_slope_heating

Description Heating slope of QF calculation.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables AHSlope_Heating_WD, AHSlope_Heating_WE

ahprof_24hr

Description Hourly profile values used in energy use calculation.

Dimensionality (24, 2)

Dimensionality Remarks 24: hours of a day

2: {Weekday, Weekend}

SUEWS-related variables EnergyUseProfWD, EnergyUseProfWE

alb

Description Effective surface albedo (middle of the day value) for summertime.

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables AlbedoMax

albdectr_id

Description Albedo of deciduous surface DecTr on day 0 of run

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables albDecTr0

albevetr_id

Description Albedo of evergreen surface EveTr on day 0 of run

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables albEveTr0

albggrass_id

Description Albedo of grass surface Grass on day 0 of run

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables albGrass0

albmax_dectr

Description Effective surface albedo (middle of the day value) for summertime.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [AlbedoMax](#)

albmax_evetr

Description Effective surface albedo (middle of the day value) for summertime.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [AlbedoMax](#)

albmax_grass

Description Effective surface albedo (middle of the day value) for summertime.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [AlbedoMax](#)

albmin_dectr

Description Effective surface albedo (middle of the day value) for wintertime (not including snow).

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [AlbedoMin](#)

albmin_evetr

Description Effective surface albedo (middle of the day value) for wintertime (not including snow).

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [AlbedoMin](#)

albmin_grass

Description Effective surface albedo (middle of the day value) for wintertime (not including snow).

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [AlbedoMin](#)

alpha_bioco2

Description The mean apparent ecosystem quantum. Represents the initial slope of the light-response curve.

Dimensionality (3,)

Dimensionality Remarks 3: { [EveTr](#), [DecTr](#), [Grass](#) }

SUEWS-related variables [alpha](#)

alpha_enh_bioco2

Description Part of the `alpha` coefficient related to the fraction of vegetation.

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables `alpha_enh`

alt

Description Altitude of grids [m].

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `Alt`

baset

Description Base Temperature for initiating growing degree days (GDD) for leaf growth. [°C]

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables `BaseT`

baseTe

Description Base temperature for initiating sensescence degree days (SDD) for leaf off. [°C]

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables `BaseTe`

basethdd

Description Base temperature for heating degree days [°C]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `BaseTHDD`

beta_bioco2

Description The light-saturated gross photosynthesis of the canopy. [$\text{umol m}^{-2} \text{ s}^{-1}$]

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables `beta`

beta_enh_bioco2

Description Part of the `beta` coefficient related to the fraction of vegetation.

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables `beta_enh`

bldgh

Description Mean building height [m]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [H_Bldgs](#)

capmax_dec

Description Maximum water storage capacity for upper surfaces (i.e. canopy)

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [StorageMax](#)

capmin_dec

Description Minimum water storage capacity for upper surfaces (i.e. canopy).

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [StorageMin](#)

chanohm

Description Bulk transfer coefficient for this surface to use in AnOHM [-]

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water }

SUEWS-related variables [AnOHM_Ch](#)

co2pointsource

Description CO2 emission factor [kg km⁻¹]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [CO2PointSource](#)

cpanohm

Description Volumetric heat capacity for this surface to use in AnOHM [J m⁻³]

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water }

SUEWS-related variables [AnOHM_Cp](#)

crwmax

Description Maximum water holding capacity of snow [mm]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [CRWMax](#)

crwmin

Description Minimum water holding capacity of snow [mm]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables CRWMin

daywat

Description Irrigation flag: 1 for on and 0 for off.

Dimensionality (7,)

Dimensionality Remarks 7: {Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday}

SUEWS-related variables DayWat (1), DayWat (2), DayWat (3), DayWat (4),
DayWat (5), DayWat (6), DayWat (7)

daywatper

Description Fraction of properties using irrigation for each day of a week.

Dimensionality (7,)

Dimensionality Remarks 7: {Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday}

SUEWS-related variables DayWatPer (1), DayWatPer (2), DayWatPer (3),
DayWatPer (4), DayWatPer (5), DayWatPer (6), DayWatPer (7)

decidcap_id

Description Storage capacity of deciduous surface DecTr on day 0 of run.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables decidCap0

dectreeh

Description Mean height of deciduous trees [m]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables H_DecTr

diagnose

Description Internal use. Please DO NOT modify

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables None

diagqn

Description Internal use. Please DO NOT modify

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables None

diagqs

Description Internal use. Please DO NOT modify

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables None

drainrt

Description Drainage rate of bucket for LUMPS [mm h⁻¹]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `LUMPS_DrRate`

ef_umolco2perj

Description Emission factor for fuels used for building heating.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `EF_umolCO2perJ`

emis

Description Effective surface emissivity.

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `Emissivity`

emissionsmethod

Description Determines method for QF calculation.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `EmissionsMethod`

enddls

Description End of the day light savings [DOY]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `EndDLS`

enef_v_jkm

Description Emission factor for heat [J k|m⁻¹|].

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `EnEF_v_Jkm`

evapmethod

Description Internal use. Please DO NOT modify

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables None

evetreeh

Description Mean height of evergreen trees [m]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [H_EveTr](#)

faibldg

Description Frontal area index for buildings [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [FAI_Bldgs](#)

faidectree

Description Frontal area index for deciduous trees [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [FAI_DecTr](#)

faietree

Description Frontal area index for evergreen trees [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [FAI_EveTr](#)

faut

Description Fraction of irrigated area that is irrigated using automated systems

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [Faut](#)

fcef_v_kgkm

Description CO2 emission factor for weekdays [kg km^{-1}];;CO2 emission factor for weekends [kg km^{-1}]

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables [FcEF_v_kgkmWD](#), [FcEF_v_kgkmWE](#)

flowchange

Description Difference in input and output flows for water surface [mm h^{-1}]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [FlowChange](#)

frfossilfuel_heat

Description Fraction of fossil fuels used for building heating [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [FrFossilFuel_Heat](#)

frfossilfuel_nonheat

Description Fraction of fossil fuels used for building energy use [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [FrFossilFuel_NonHeat](#)

g1

Description Related to maximum surface conductance [mm s⁻¹]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [G1](#)

g2

Description Related to Kdown dependence [W m⁻²]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [G2](#)

g3

Description Related to VPD dependence [units depend on [gsModel](#)]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [G3](#)

g4

Description Related to VPD dependence [units depend on [gsModel](#)]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [G4](#)

g5

Description Related to temperature dependence [°C]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [G5](#)

g6

Description Related to soil moisture dependence [mm⁻¹]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [G6](#)

gddfull

Description The growing degree days (GDD) needed for full capacity of the leaf area index (LAI) [°C].

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass }

SUEWS-related variables [GDDFull](#)

gsmodel

Description Formulation choice for conductance calculation.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [gsModel1](#)

humactivity_24hr

Description Hourly profile values used in human activity calculation.

Dimensionality (24, 2)

Dimensionality Remarks 24: hours of a day

2: { Weekday, Weekend }

SUEWS-related variables [ActivityProfWD](#), [ActivityProfWE](#)

ie_a

Description Coefficient for automatic irrigation model.

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass }

SUEWS-related variables [Ie_a1](#), [Ie_a2](#), [Ie_a3](#)

ie_end

Description Day when irrigation ends [DOY]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [Ie_end](#)

ie_m

Description Coefficient for manual irrigation model.

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass }

SUEWS-related variables `Ie_m1, Ie_m2, Ie_m3`

ie_start

Description Day when irrigation starts [DOY]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `Ie_start`

internalwateruse_h

Description Internal water use [mm h⁻¹]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `InternalWaterUse`

irrfracconif

Description Fraction of evergreen trees that are irrigated [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `IrrFr_EveTr`

irrfracdecid

Description Fraction of deciduous trees that are irrigated [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `IrrFr_DecTr`

irrfracgrass

Description Fraction of Grass that is irrigated [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `IrrFr_Grass`

kknohm

Description Thermal conductivity for this surface to use in AnOHM [W m K⁻¹]

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water }

SUEWS-related variables `AnOHM_Kk`

kmax

Description Maximum incoming shortwave radiation [W m⁻²]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `Kmax`

lai_id

Description Initial LAI values.

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables LAIinitialDecTr, LAIinitialEveTr, LAIinitialGrass

laicalcyes

Description Internal use. Please DO NOT modify

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables None

laimax

Description full leaf-on summertime value

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables LAIMax

laimin

Description leaf-off wintertime value

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables LAIMin

laipower

Description parameters required by LAI calculation.

Dimensionality (4, 3)

Dimensionality Remarks 4: {LeafGrowthPower1, LeafGrowthPower2, LeafOffPower1, LeafOffPower2}

3: { EveTr, DecTr, Grass}

SUEWS-related variables LeafGrowthPower1, LeafGrowthPower2, LeafOffPower1, LeafOffPower2

laitype

Description LAI calculation choice.

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass}

SUEWS-related variables LAIEq

lat

Description Latitude [deg].

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [lat](#)

lng

Description longitude [deg]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [lng](#)

maxconductance

Description The maximum conductance of each vegetation or surface type. [mm s^{-1}]

Dimensionality (3,)

Dimensionality Remarks 3: { [EveTr](#), [DecTr](#), [Grass](#) }

SUEWS-related variables [MaxConductance](#)

maxfcmetab

Description Maximum (day) CO₂ from human metabolism. [W m^{-2}]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [MaxFCMetab](#)

maxqfmetab

Description Maximum value for human heat emission. [W m^{-2}]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [MaxQFMetab](#)

min_res_bioco2

Description Minimum soil respiration rate (for cold-temperature limit) [$\text{umol m}^{-2} \text{ s}^{-1}$].

Dimensionality (3,)

Dimensionality Remarks 3: { [EveTr](#), [DecTr](#), [Grass](#) }

SUEWS-related variables [min_respi](#)

minfcmetab

Description Minimum (night) CO₂ from human metabolism. [W m^{-2}]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [MinFCMetab](#)

minqfmetab

Description Minimum value for human heat emission. [W m^{-2}]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables [MinQFMetab](#)

narp_emis_snow

Description Effective surface emissivity.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `Emissivity`

narp_trans_site

Description Atmospheric transmissivity for NARP [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `NARP_Trans`

netradiationmethod

Description Determines method for calculation of radiation fluxes.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `NetRadiationMethod`

ohm_coef

Description Coefficients for OHM calculation.

Dimensionality (8, 4, 3)

Dimensionality Remarks 8: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water`, one extra land cover type (currently NOT used)}

4: {`SummerWet`, `SummerDry`, `WinterWet`, `WinterDry`}

3: {`a1`, `a2`, `a3`}

SUEWS-related variables `a1`, `a2`, `a3`

ohm_threshsw

Description Temperature threshold determining whether summer/winter OHM coefficients are applied [°C]

Dimensionality (8,)

Dimensionality Remarks 8: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water`, one extra land cover type (currently NOT used)}

SUEWS-related variables `OHMThresh_SW`

ohm_threshwd

Description Soil moisture threshold determining whether wet/dry OHM coefficients are applied [-]

Dimensionality (8,)

Dimensionality Remarks 8: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water`, one extra land cover type (currently NOT used)}

SUEWS-related variables `OHMThresh_WD`

ohmincqf

Description Determines whether the storage heat flux calculation uses Q^* or ($Q^* + QF$).

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `OHMIncQF`

`pipecapacity`

Description Storage capacity of pipes [mm]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `PipeCapacity`

`popdensdaytime`

Description Daytime population density (i.e. workers, tourists) [people ha⁻¹]

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables `PopDensDay`

`popdensnighttime`

Description Night-time population density (i.e. residents) [people ha⁻¹]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `PopDensNight`

`popprof_24hr`

Description Hourly profile values used in dynamic population estimation.

Dimensionality (24, 2)

Dimensionality Remarks 24: hours of a day

2: {Weekday, Weekend}

SUEWS-related variables `PopProfWD`, `PopProfWE`

`pormax_dec`

Description full leaf-on summertime value Used only for `DecTr` (can affect roughness calculation)

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `PorosityMax`

`pormin_dec`

Description leaf-off wintertime value Used only for `DecTr` (can affect roughness calculation)

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `PorosityMin`

`porosity_id`

Description Porosity of deciduous vegetation on day 0 of run.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables porosity0

`preciplimit`

Description Temperature limit when precipitation falls as snow [°C]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables PrecipLimSnow

`preciplimitalb`

Description Limit for hourly precipitation when the ground is fully covered with snow [mm]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables PrecipLimAlb

`qf0_beu`

Description Building energy use [W m^{-2}]

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables QF0_BEU_WD, QF0_BEU_WE

`qf_a`

Description Base value for QF calculation.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables QF_A_WD, QF_A_WE

`qf_b`

Description Parameter related to heating degree days.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables QF_B_WD, QF_B_WE

`qf_c`

Description Parameter related to heating degree days.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables QF_C_WD, QF_C_WE

`radmeltfact`

Description Hourly radiation melt factor of snow [$\text{mm W}^{-1} \text{ h}^{-1}$]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `RadMeltFactor`

raincover

Description Limit when surface totally covered with water for LUMPS [mm]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `LUMPS_Cover`

rainmaxres

Description Maximum water bucket reservoir [mm] Used for LUMPS surface wetness control.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `LUMPS_MaxRes`

resp_a

Description Respiration coefficient a.

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass }

SUEWS-related variables `resp_a`

resp_b

Description Respiration coefficient b - related to air temperature dependency.

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass }

SUEWS-related variables `resp_b`

roughlenheatmethod

Description Determines method for calculating roughness length for heat.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `RoughLenHeatMethod`

roughlenmommethod

Description Determines how aerodynamic roughness length (z_{0m}) and zero displacement height (z_{dm}) are calculated.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `RoughLenMomMethod`

runofftowater

Description Fraction of above-ground runoff flowing to water surface during flooding [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables RunoffToWater

s1

Description A parameter related to soil moisture dependence [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables S1

s2

Description A parameter related to soil moisture dependence [mm]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables S2

sathydraulicconduct

Description Hydraulic conductivity for saturated soil [mm s⁻¹]

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water }

SUEWS-related variables SatHydraulicCond

sddfull

Description The sensesence degree days (SDD) needed to initiate leaf off. [°C]

Dimensionality (3,)

Dimensionality Remarks 3: { EveTr, DecTr, Grass }

SUEWS-related variables SDDFull

sfr

Description Surface cover fractions.

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water }

SUEWS-related variables Fr_Bldgs, Fr_Bsoil, Fr_DecTr, Fr_EveTr, Fr_Grass, Fr_Paved, Fr_Water

smdmethod

Description Determines method for calculating soil moisture deficit (SMD).

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables SMDMethod

snowalb

Description Initial snow albedo

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `SnowAlb0`

snowalbmax

Description Effective surface albedo (middle of the day value) for summertime.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `AlbedoMax`

snowalbmin

Description Effective surface albedo (middle of the day value) for wintertime (not including snow).

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `AlbedoMin`

snowdens

Description Initial snow density of each land cover.

Dimensionality (7,)

Dimensionality Remarks 7: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water` }

SUEWS-related variables `SnowDensBldgs`, `SnowDensPaved`, `SnowDensDecTr`,
`SnowDensEveTr`, `SnowDensGrass`, `SnowDensBSoil`, `SnowDensWater`

snowdensmax

Description Maximum snow density [kg m^{-3}]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `SnowDensMax`

snowdensmin

Description Fresh snow density [kg m^{-3}]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `SnowDensMin`

snowfrac

Description Initial plan area fraction of snow on each land cover[‘]

Dimensionality (7,)

Dimensionality Remarks 7: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water` }

SUEWS-related variables `SnowFracBldgs`, `SnowFracPaved`, `SnowFracDecTr`,
`SnowFracEveTr`, `SnowFracGrass`, `SnowFracBSoil`, `SnowFracWater`

snowlimbldg

Description Limit of the snow water equivalent for snow removal from roads and roofs [mm]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `SnowLimRemove`

snowlimpaved

Description Limit of the snow water equivalent for snow removal from roads and roofs [mm]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `SnowLimRemove`

snowpack

Description Initial snow water equivalent on each land cover

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `SnowPackBldgs`, `SnowPackPaved`, `SnowPackDecTr`,
`SnowPackEveTr`, `SnowPackGrass`, `SnowPackBSoil`, `SnowPackWater`

snowpacklimit

Description Limit for the snow water equivalent when snow cover starts to be patchy [mm]

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `SnowLimPatch`

snowprof_24hr

Description Hourly profile values used in snow clearing.

Dimensionality (24, 2)

Dimensionality Remarks 24: hours of a day

2: {Weekday, Weekend}

SUEWS-related variables `SnowClearingProfWD`, `SnowClearingProfWE`

snowuse

Description Determines whether the snow part of the model runs.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `SnowUse`

snowwater

Description Initial amount of liquid water in the snow on each land cover

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `SnowWaterBldgsState`, `SnowWaterPavedState`,
`SnowWaterDecTrState`, `SnowWaterEveTrState`, `SnowWaterGrassState`,
`SnowWaterBSoilState`, `SnowWaterWaterState`

`soildepth`

Description Depth of soil beneath the surface [mm]

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `SoilDepth`

`soilstore_id`

Description Initial water stored in soil beneath each land cover

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `SoilstoreBldgsState`, `SoilstorePavedState`,
`SoilstoreDecTrState`, `SoilstoreEveTrState`, `SoilstoreGrassState`,
`SoilstoreBSoilState`

`soilstorecap`

Description Limit value for `SoilDepth` [mm]

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `SoilStoreCap`

`stabilitymethod`

Description Defines which atmospheric stability functions are used.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `StabilityMethod`

`startdls`

Description Start of the day light savings [DOY]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `StartDLS`

`state_id`

Description Initial wetness condition on each land cover

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `BldgsState`, `PavedState`, `DecTrState`, `EveTrState`,
`GrassState`, `BSoilState`, `WaterState`

`statelimit`

Description Upper limit to the surface state. [mm]

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables `StateLimit`

storageheatmethod

Description Determines method for calculating storage heat flux ΔQ_S .

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `StorageHeatMethod`

storedrainprm

Description Coefficients used in drainage calculation.

Dimensionality (6, 7)

Dimensionality Remarks 6: { `StorageMin`, `DrainageEq`, `DrainageCoef1`,
`DrainageCoef2`, `StorageMax`, current storage}

7: { `Paved`, `Bldgs`, `EveTr`, `DecTr`, `Grass`, `BSoil`, `Water`}

SUEWS-related variables `DrainageCoef1`, `DrainageCoef2`, `DrainageEq`,
`StorageMax`, `StorageMin`

surfacearea

Description Area of the grid [ha].

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `SurfaceArea`

t_critic_cooling

Description Critical cooling temperature.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables `TCritic_Cooling_WD`, `TCritic_Cooling_WE`

t_critic_heating

Description Critical heating temperature.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables `TCritic_Heating_WD`, `TCritic_Heating_WE`

tau_a

Description Time constant for snow albedo aging in cold snow [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `tau_a`

tau_f

Description Time constant for snow albedo aging in melting snow [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `tau_f`

tau_r

Description Time constant for snow density ageing [-]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `tau_r`

tempmeltfact

Description Hourly temperature melt factor of snow [mm K⁻¹ h⁻¹]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `TempMeltFactor`

th

Description Upper air temperature limit [°C]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `TH`

theta.bioco2

Description The convexity of the curve at light saturation.

Dimensionality (3,)

Dimensionality Remarks 3: { `EveTr`, `DecTr`, `Grass` }

SUEWS-related variables `theta`

timezone

Description Time zone [h] for site relative to UTC (east is positive). This should be set according to the times given in the meteorological forcing file(s).

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `Timezone`

t1

Description Lower air temperature limit [°C]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables `TL`

trafficrate

Description Traffic rate used for CO2 flux calculation.

Dimensionality (2,)

Dimensionality Remarks 2: {Weekday, Weekend}

SUEWS-related variables TrafficRate_WD, TrafficRate_WE

trafficunits

Description Units for the traffic rate for the study area. Not used in v2018a.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables TrafficUnits

traffprof_24hr

Description Hourly profile values used in traffic activity calculation.

Dimensionality (24, 2)

Dimensionality Remarks 24: hours of a day

2: {Weekday, Weekend}

SUEWS-related variables TraffProfWD, TraffProfWE

tstep

Description Specifies the model time step [s].

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables Tstep

veg_type

Description Internal use. Please DO NOT modify

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables None

waterdist

Description Fraction of water redistribution

Dimensionality (8, 6)

Dimensionality Remarks 8: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water, one extra land cover type (currently NOT used)}

6: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil}

SUEWS-related variables ToBSoil, ToBldgs, ToDecTr, ToEveTr, ToGrass, ToPaved, ToRunoff, ToSoilStore, ToWater

waterusemethod

Description Defines how external water use is calculated.

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables WaterUseMethod

wetthresh

Description Depth of water which determines whether evaporation occurs from a partially wet or completely wet surface [mm].

Dimensionality (7,)

Dimensionality Remarks 7: { Paved, Bldgs, EveTr, DecTr, Grass, BSoil, Water}

SUEWS-related variables WetThreshold

wuprofa_24hr

Description Hourly profile values used in automatic irrigation.

Dimensionality (24, 2)

Dimensionality Remarks 24: hours of a day

2: {Weekday, Weekend}

SUEWS-related variables WaterUseProfAutoWD, WaterUseProfAutoWE

wuprofm_24hr

Description Hourly profile values used in manual irrigation.

Dimensionality (24, 2)

Dimensionality Remarks 24: hours of a day

2: {Weekday, Weekend}

SUEWS-related variables WaterUseProfManuWD, WaterUseProfManuWE

z

Description Measurement height [m].

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables z

z0m_in

Description Roughness length for momentum [m]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables z0

zdm_in

Description Zero-plane displacement [m]

Dimensionality 0

Dimensionality Remarks Scalar

SUEWS-related variables zd

3.4.2 df_forcing variables

Note: Data structure of df_forcing is explained [here](#).

RH**Description** Relative Humidity [%]**Tair****Description** Air temperature [°C]**U****Description** Wind speed [m s⁻¹] Height of the wind speed measurement (z) is needed in SUEWS_SiteSelect.txt.**Wuh****Description** External water use [m³]**fcld****Description** Cloud fraction [tenths]**id****Description** Day of year [DOY]**imin****Description** Minute [M]**isec****Description** Second [S]**it****Description** Hour [H]**iy****Description** Year [YYYY]**kdiff****Description** Diffuse radiation [W m⁻²] **Recommended in this version.** if SOLWEIGUse = 1**kdir****Description** Direct radiation [W m⁻²] **Recommended in this version.** if SOLWEIGUse = 1**kdown****Description** Incoming shortwave radiation [W m⁻²] Must be > 0 W m⁻².**lai****Description** Observed leaf area index [m² m⁻²]**ldown****Description** Incoming longwave radiation [W m⁻²]**pres****Description** Barometric pressure [kPa]**qe****Description** Latent heat flux [W m⁻²]**qf**

Description Anthropogenic heat flux [W m^{-2}]

qh

Description Sensible heat flux [W m^{-2}]

qn

Description Net all-wave radiation [W m^{-2}] Required if `NetRadiationMethod` = 0.

qs

Description Storage heat flux [W m^{-2}]

rain

Description Rainfall [mm]

snow

Description Snow cover fraction (0 – 1) [-] Required if `SnowUse` = 1

wdir

Description Wind direction [$^{\circ}$] **Not available in this version.**

xsmld

Description Observed soil moisture [$\text{m}^3 \text{ m}^{-3}$] or [kg kg^{-1}]

3.4.3 df_output variables

Note: Data structure of `df_output` is explained [here](#).

AddWater

Description Additional water flow received from other grids [mm]

Group SUEWS

AlbBulk

Description Bulk albedo [-]

Group SUEWS

AlbDecTr

Description Albedo of deciduous trees [-]

Group DailyState

AlbEveTr

Description Albedo of evergreen trees [-]

Group DailyState

AlbGrass

Description Albedo of grass [-]

Group DailyState

AlbSnow

Description Snow albedo [-]

Group SUEWS

AlbSnow

Description Snow albedo [-]

Group DailyState

Azimuth

Description Solar azimuth angle [°]

Group SUEWS

CI

Description clearness index for Ldown (Lindberg et al. 2008)

Group SOLWEIG

DLHrs

Description Day length [h]

Group DailyState

DaysSR

Description Days since rain [days]

Group DailyState

DecidCap

Description Moisture storage capacity of deciduous trees [mm]

Group DailyState

DensSnow_BSoil

Description Snow density – bare soil surface [kg m^{-3}]

Group DailyState

DensSnow_BSoil

Description Snow density - bare soil surface [kg m^{-3}]

Group snow

DensSnow_BSoil

Description Snow density - bare soil surface [kg m^{-3}]

Group DailyState

DensSnow_BSoil

Description Snow density – bare soil surface [kg m^{-3}]

Group snow

DensSnow_Bldgs

Description Snow density - building surface [kg m^{-3}]

Group DailyState

DensSnow_Bldgs

Description Snow density - building surface [kg m^{-3}]

Group snow

DensSnow_Bldgs

Description Snow density – building surface [kg m⁻³]

Group snow

DensSnow_Bldgs

Description Snow density – building surface [kg m⁻³]

Group DailyState

DensSnow_DecTr

Description Snow density – deciduous surface [kg m⁻³]

Group DailyState

DensSnow_DecTr

Description Snow density - deciduous surface [kg m⁻³]

Group DailyState

DensSnow_DecTr

Description Snow density – deciduous surface [kg m⁻³]

Group snow

DensSnow_DecTr

Description Snow density - deciduous surface [kg m⁻³]

Group snow

DensSnow_EveTr

Description Snow density - evergreen surface [kg m⁻³]

Group snow

DensSnow_EveTr

Description Snow density – evergreen surface [kg m⁻³]

Group snow

DensSnow_EveTr

Description Snow density - evergreen surface [kg m⁻³]

Group DailyState

DensSnow_EveTr

Description Snow density – evergreen surface [kg m⁻³]

Group DailyState

DensSnow_Grass

Description Snow density - grass surface [kg m⁻³]

Group snow

DensSnow_Grass

Description Snow density – grass surface [kg m⁻³]

Group DailyState

DensSnow_Grass

Description Snow density – grass surface [kg m⁻³]

Group snow

DensSnow_Grass

Description Snow density - grass surface [kg m⁻³]

Group DailyState

DensSnow_Paved

Description Snow density - paved surface [kg m⁻³]

Group snow

DensSnow_Paved

Description Snow density – paved surface [kg m⁻³]

Group snow

DensSnow_Paved

Description Snow density - paved surface [kg m⁻³]

Group DailyState

DensSnow_Paved

Description Snow density – paved surface [kg m⁻³]

Group DailyState

DensSnow_Water

Description Snow density – water surface [kg m⁻³]

Group DailyState

DensSnow_Water

Description Snow density - water surface [kg m⁻³]

Group DailyState

DensSnow_Water

Description Snow density – water surface [kg m⁻³]

Group snow

DensSnow_Water

Description Snow density - water surface [kg m⁻³]

Group snow

DiffuseRad

Description Diffuse shortwave radiation

Group SOLWEIG

DirectRad

Description Direct shortwave radiation

Group SOLWEIG

Drainage

Description Drainage [mm]

Group SUEWS

Evap

Description Evaporation [mm]

Group SUEWS

Fc

Description CO₂ flux [umol m⁻² s⁻¹]

Group SUEWS

FcBuild

Description CO₂ flux from buildings [umol m⁻² s⁻¹]

Group SUEWS

FcMetab

Description CO₂ flux from metabolism [umol m⁻² s⁻¹]

Group SUEWS

FcPhoto

Description CO₂ flux from photosynthesis [umol m⁻² s⁻¹]

Group SUEWS

FcPoint

Description CO₂ flux from point source [umol m⁻² s⁻¹]

Group SUEWS

FcRespi

Description CO₂ flux from respiration [umol m⁻² s⁻¹]

Group SUEWS

FcTraff

Description CO₂ flux from traffic [umol m⁻² s⁻¹]

Group SUEWS

Fcld

Description Cloud fraction [-]

Group SUEWS

FlowCh

Description Additional flow into water body [mm]

Group SUEWS

GDD_DecTr

Description Growing degree days for deciduous tree [°C d]

Group DailyState

GDD_EveTr

Description Growing degree days for evergreen tree [$^{\circ}\text{C d}$]

Group DailyState

GDD_Grass

Description Growing degree days for grass [$^{\circ}\text{C d}$]

Group DailyState

GlobalRad

Description Input Kdn

Group SOLWEIG

HDD1_h

Description Heating degree days [$^{\circ}\text{C d}$]

Group DailyState

HDD2_c

Description Cooling degree days [$^{\circ}\text{C d}$]

Group DailyState

HDD3_Tmean

Description Average daily air temperature [$^{\circ}\text{C}$]

Group DailyState

HDD4_T5d

Description 5-day running-mean air temperature [$^{\circ}\text{C}$]

Group DailyState

I0

Description theoretical value of maximum incoming solar radiation

Group SOLWEIG

Irr

Description Irrigation [mm]

Group SUEWS

Kdown

Description Incoming shortwave radiation [W m^{-2}]

Group SUEWS

Kdown2d

Description Incoming shortwave radiation at POI

Group SOLWEIG

Keast

Description Shortwave radiation from east at POI

Group SOLWEIG

Knorth

Description Shortwave radiation from north at POI

Group SOLWEIG

Ksouth

Description Shortwave radiation from south at POI

Group SOLWEIG

Kup

Description Outgoing shortwave radiation [W m^{-2}]

Group SUEWS

Kup2d

Description Outgoing shortwave radiation at POI

Group SOLWEIG

Kwest

Description Shortwave radiation from west at POI

Group SOLWEIG

LAI

Description Leaf area index [$\text{m}^2 \text{ m}^{-2}$]

Group SUEWS

LAI_DecTr

Description Leaf area index of deciduous trees [$\text{m}^2 \text{ m}^{-2}$]

Group DailyState

LAI_EveTr

Description Leaf area index of evergreen trees [$\text{m}^2 \text{ m}^{-2}$]

Group DailyState

LAI_Grass

Description Leaf area index of grass [$\text{m}^2 \text{ m}^{-2}$]

Group DailyState

LAIlumps

Description Leaf area index used in LUMPS (normalised 0-1) [-]

Group DailyState

Ldown

Description Incoming longwave radiation [W m^{-2}]

Group SUEWS

Ldown2d

Description Incoming longwave radiation at POI

Group SOLWEIG

Least

Description Longwave radiation from east at POI

Group SOLWEIG

Lnorth

Description Longwave radiation from north at POI

Group SOLWEIG

Lob

Description Obukhov length [m]

Group SUEWS

Lsouth

Description Longwave radiation from south at POI

Group SOLWEIG

Lup

Description Outgoing longwave radiation [W m^{-2}]

Group SUEWS

Lup2d

Description Outgoing longwave radiation at POI

Group SOLWEIG

Lwest

Description Longwave radiation from west at POI

Group SOLWEIG

MeltWStore

Description Meltwater store [mm]

Group SUEWS

MeltWater

Description Meltwater [mm]

Group SUEWS

MwStore_BSoil

Description Melt water store – bare soil surface [mm]

Group snow

MwStore_Bldgs

Description Melt water store – building surface [mm]

Group snow

MwStore_DecTr

Description Melt water store – deciduous surface [mm]

Group snow

MwStore_EveTr

Description Melt water store – evergreen surface [mm]

Group snow

MwStore_Grass

Description Melt water store – grass surface [mm]

Group snow

MwStore_Paved

Description Melt water store – paved surface [mm]

Group snow

MwStore_Water

Description Melt water store – water surface [mm]

Group snow

Mw_BSoil

Description Meltwater – bare soil surface [mm h⁻¹]

Group snow

Mw_Bldgs

Description Meltwater – building surface [mm h⁻¹]

Group snow

Mw_DecTr

Description Meltwater – deciduous surface [mm h⁻¹]

Group snow

Mw_EveTr

Description Meltwater – evergreen surface [mm h⁻¹]

Group snow

Mw_Grass

Description Meltwater – grass surface [mm h⁻¹ 1]

Group snow

Mw_Paved

Description Meltwater – paved surface [mm h⁻¹]

Group snow

Mw_Water

Description Meltwater – water surface [mm h⁻¹]

Group snow

NWtrState

Description Surface wetness state (for non-water surfaces) [mm]

Group SUEWS

P_day

Description Daily total precipitation [mm]

Group DailyState

Porosity

Description Porosity of deciduous trees [-]

Group DailyState

Q2

Description Air specific humidity at 2 m agl [g kg^{-1}]

Group SUEWS

QE

Description Latent heat flux (calculated using SUEWS) [W m^{-2}]

Group SUEWS

QE1umps

Description Latent heat flux (calculated using LUMPS) [W m^{-2}]

Group SUEWS

QF

Description Anthropogenic heat flux [W m^{-2}]

Group SUEWS

QH

Description Sensible heat flux (calculated using SUEWS) [W m^{-2}]

Group SUEWS

QH1umps

Description Sensible heat flux (calculated using LUMPS) [W m^{-2}]

Group SUEWS

QHresis

Description Sensible heat flux (calculated using resistance method) [W m^{-2}]

Group SUEWS

QM

Description Snow-related heat exchange [W m^{-2}]

Group SUEWS

QMfreeze

Description Internal energy change [W m^{-2}]

Group SUEWS

QMRain

Description Heat released by rain on snow [W m^{-2}]

Group SUEWS

QN

Description Net all-wave radiation [W m^{-2}]

Group SUEWS

QNSnow

Description Net all-wave radiation for snow area [W m^{-2}]

Group SUEWS

QNSnowFr

Description Net all-wave radiation for snow-free area [W m^{-2}]

Group SUEWS

QS

Description Storage heat flux [W m^{-2}]

Group SUEWS

Qa_BSoil

Description Advective heat – bare soil surface [W m^{-2}]

Group snow

Qa_Bldgs

Description Advective heat – building surface [W m^{-2}]

Group snow

Qa_DecTr

Description Advective heat – deciduous surface [W m^{-2}]

Group snow

Qa_EveTr

Description Advective heat – evergreen surface [W m^{-2}]

Group snow

Qa_Grass

Description Advective heat – grass surface [W m^{-2}]

Group snow

Qa_Paved

Description Advective heat – paved surface [W m^{-2}]

Group snow

Qa_Water

Description Advective heat – water surface [W m^{-2}]

Group snow

QmFr_BSoil

Description Heat related to freezing of surface store – bare soil surface [W m^{-2}]

Group snow

QmFr_Bldgs

Description Heat related to freezing of surface store – building surface [W m^{-2}]

Group snow

QmFr_DecTr

Description Heat related to freezing of surface store – deciduous surface [W m^{-2}]

Group snow

QmFr_EveTr

Description Heat related to freezing of surface store – evergreen surface [W m^{-2}]

Group snow

QmFr_Grass

Description Heat related to freezing of surface store – grass surface [W m^{-2}]

Group snow

QmFr_Paved

Description Heat related to freezing of surface store – paved surface [W m^{-2}]

Group snow

QmFr_Water

Description Heat related to freezing of surface store – water [W m^{-2}]

Group snow

Qm_BSoil

Description Snowmelt-related heat – bare soil surface [W m^{-2}]

Group snow

Qm_Bldgs

Description Snowmelt-related heat – building surface [W m^{-2}]

Group snow

Qm_DecTr

Description Snowmelt-related heat – deciduous surface [W m^{-2}]

Group snow

CHAPTER 4

FAQ

Contents

- *I cannot install SuPy following the docs, what is wrong there?*
- *How do I know which version of SuPy I am using?*
- *A kernel may have died exception happened, where did I go wrong?*
- *How can I upgrade SuPy to an up-to-date version?*

4.1 I cannot install SuPy following the docs, what is wrong there?

please check if your environment meets the following requirements:

1. Operating system (OS):
 - a. is it 64 bit? only 64 bit systems are supported.
 - b. is your OS up to date? only recent desktop systems are supported:
 - Windows 10 and above
 - macOS 10.13 and above
 - Linux: no restriction; If SuPy cannot run on your specific Linux distribution, please report it to us.

You can get the OS information with the following code:

```
import platform  
platform.platform()
```

2. Python interpreter:

- a. is your Python interpreter 64 bit?

Check running mode with the following code:

```
import struct  
struct.calcsize('P') * 8
```

- b. is your Python version above 3.5?

Check version info with the following code:

```
import sys  
sys.version
```

If your environment doesn't meet the requirement by SuPy, please use a proper environment; otherwise, [please report your issue](#).

4.2 How do I know which version of SuPy I am using?

Use the following code:

```
import supy  
supy.show_version()
```

Note: `show_version` is only available after v2019.5.28.

4.3 A kernel may have died exception happened, where did I go wrong?

The issue is highly likely due to invalid input to SuPy and SUEWS kernel. We are trying to avoid such exceptions, but unfortunately they might happen in some edge cases.

Please [report such issues to us](#) with your input files for debugging. Thanks!

4.4 How can I upgrade SuPy to an up-to-date version?

Run the following code in your terminal:

```
python3 -m pip install supy --upgrade
```

CHAPTER 5

Version History

5.1 Version Dev

- **New**

1. Update supy-driver to 2020a iteration.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

1. ESTM is not supported yet.
2. BLUEWS, a CBL modules in SUEWS, is not supported yet.
3. Simulation in parallel mode is NOT supported on Windows due to system limitation.

5.2 Version 2020.2.2

- **New**

1. A checker to validate input DataFrame's. See option `check_input` in `run_supy`.
2. Utilities to generate forcing data using ERA-5 data. See `download_era5` and `gen_forcing_era5`.

- **Improvement**

1. Improved performance of the parallel mode.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

1. ESTM is not supported yet.
2. BLUEWS, a CBL modules in SUEWS, is not supported yet.
3. Simulation in parallel mode is NOT supported on Windows due to system limitation.

5.3 Version 2019.8.29

- **New**

1. added WRF-SUEWS related functions.
2. added [diagnostics of canyon profiles](#).

- **Improvement**

None.

- **Changes**

1. synchronised with v2019a interface: minimum supy_driver v2019a2.

- **Fix**

None.

- **Known issue**

1. ESTM is not supported yet.
2. BLUEWS, a CBL modules in SUEWS, is not supported yet.
3. Performance in parallel mode can be worse than serial mode sometimes due to heavy (de)-serialisation loads.

5.4 Version 2019.7.17

- **New**

1. added OHM related functions.
2. added surface conductance related functions.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

1. Fixed a bug in unit conversion for TMY data generation.

- **Known issue**

ESTM is not supported yet.

5.5 Version 2019.6.8

- **New**

None.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

1. Fixed a bug in rescaling Kdown when loading forcing data.

- **Known issue**

ESTM is not supported yet.

5.6 Version 2019.5.28

Spring house cleaning with long-await command line tools (more on the way!).

- **New**

1. Added version info function: `show_version`.

2. Added command line tools:

– `suews-run`: SuPy wrapper to mimic SUEWS-binary-based simulation.

– `suews-convert`: convert input tables from older versions to newer ones (one-way only).

- **Improvement**

None.

- **Changes**

None.

- **Fix**

1. Fixed a bug in writing out multi-grid output files caused by incorrect dropping of temporal information by pandas .

- **Known issue**

ESTM is not supported yet.

5.7 Version 2019.4.29

Parallel run.

- **New**

Added support for parallel run on the fly.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

5.8 Version 2019.4.17

UMEP compatibility tweaks.

- **New**

None.

- **Improvement**

None.

- **Changes**

Error messages: `problems.txt` will be written out in addition to the console error message similarly as SUEWS binary.

- **Fix**

Incorrect caching of input libraries.

- **Known issue**

None

5.9 Version 2019.4.15

ERA-5 download.

- **New**

Added experimental support for downloading and processing ERA-5 data to force supy simulations.

- **Improvement**

Improved compatibility with earlier `pandas` version in resampling output.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

5.10 Version 2019.3.21

TMY generation.

- **New**

Added preliminary support for generating TMY dataset with SuPy output.

- **Improvement**

None.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

5.11 Version 2019.3.14

This release improved memory usage.

- **New**

None.

- **Improvement**

Optimised memory consumption for longterm simulations.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

5.12 Version 2019.2.25

This release dropped support for Python 3.5 and below.

- **New**

None.

- **Improvement**

None.

- **Changes**

Dropped support for Python 3.5 and below.

- **Fix**

None.

- **Known issue**

None

5.13 Version 2019.2.24

This release added the ability to save output files.

- **New**

1. Added support to save output files. See: `supy.save_supy()`
2. Added support to initialise SuPy from saved `df_state.csv`. See: `supy.init_supy()`

- **Improvement**

None.

- **Changes**

None.

- **Fix**

None.

- **Known issue**

None

5.14 Version 2019.2.19

This is a release that improved the exception handling due to fatal error in `supy_driver`.

- **New**

Added support to handle python kernel crash caused by fatal error in `supy_driver` kernel; so python kernel won't crash any more even `supy_driver` is stopped.

- **Improvement**

None.

- **Changes**

None

- **Fix**

None.

- **Known issue**

None

5.15 Version 2019.2.8

This is a release that fixes recent bugs found in SUEWS that may lead to abnormal simulation results of storage heat flux, in particular when `SnowUse` is enabled (i.e., `snowuse=1`).

- **New**

None.

- **Improvement**

Improved the performance in loading initial model state from a large number of grids (>1k)

- **Changes**

Updated SampleRun dataset by: 1. setting surface fractions (`sfr`) to a more realistic value based on London KCL case; 2. enabling snow module (`snowuse=1`).

- **Fix**

1. Fixed a bug in the calculation of storage heat flux.
2. Fixed a bug in loading `popdens` for calculating anthropogenic heat flux.

- **Known issue**

None

5.16 Version 2019.1.1 (preview release, 01 Jan 2019)

- **New**

1. Slimmed the output groups by excluding unsupported `ESTM` results
2. SuPy documentation
 - Key IO data structures documented:
 - `df_output variables` (GH9)
 - `df_state variables` (GH8)
 - `df_forcing variables` (GH7)
 - Tutorial of parallel SuPy simulations for impact studies

- **Improvement**

1. Improved calculation of OHM-related radiation terms

- **Changes**

None.

- **Fix**

None

- **Known issue**

None

5.17 Version 2018.12.15 (internal test release in December 2018)

- **New**

1. Preview release of SuPy based on the computation kernel of SUEWS 2018b

- **Improvement**

1. Improved calculation of OHM-related radiation terms

- **Changes**

None.

- **Fix**

None

- **Known issue**

1. The heat storage modules AnOHM and ESTM are not supported yet.
